

# arthur:

*a great programming language*

# Ingredients for an arthur program

- 1 **MP4** of ballers dunking
- 4 **strings**: "Hello my dear friends. Welcome to my world" || "Do you like Arthur yet?" || "Please enjoy Arthur today." || "Arthur lives"
- 1 **MP3** of a glass breaking sound
- 1 **color**: red
- ~35 lines of real live **code**

Let's show a sample!

**BALLEM**

# What?

High level media manipulation language run primarily in Java that compiles to finished static canvas-y JavaScript sites.

# Data Types: Primitives

```
num x = 5;
```

```
string x = "This language is great!";
```

```
color x = <<255, 0, 255>>;
```

```
color x = CHARTREUSE;
```

All initialized with literals |||||

Realtime manipulation

# Data Types: Non-Primitives

```
Video x = video("arthurShow.mp4");
```

```
Sound x = sound("inDaClub.mp3");
```

```
Image x = image("starwars.jpg");
```

Initialized with files |||

Java manipulation

# What would happen if you...

- Added a **color** to a **sound**?
- Multiplied two **strings**?
- Turned a **sound** into a **picture**?

We figured it out!!!!

# The main ideas

*There are two sides to arthur*

- First: **A creative process with unusual results**
  - Morphology between medias
  - A space to experiment
  - Output with a wow factor

# The main ideas, cont'd.

- Second: **A suite of editing possibilities in a single package**
  - Eliminates need for multiple software tools for different types of media
  - Condenses heavy-duty media manipulation routines into **very simple & very small code styles**

# Casting & interoperability

All types can be **cast** (->) to one another.

The operands of (+, -, /, \*) can be of any two types!

# Casting

- **Video->Sound** extracts sound from a video and saves it as an MP3
- **Video->Image** samples & combines frames from the video
- **Image->color** gets you the average color of all the pixels in the image
- **string->Sound** performs "text to speech"
- **number->Sound** ??? try it and find out

USEFUL

WACKY

Video -> image

# Interoperability

The result of an operation is the same type as its left operand.

- **Video \* number** speeds up or slows down the video by a factor
- **Sound + number** raises the sound's pitch by an amount
- **Image / Image** overlays two images
- **Video / number** tiles the video

USEFUL

WACKY

$$* 3 / 4$$

sound \* string

JUST BEING  
HONEST

# Then what?

If you want to use arthur as a tool for editing pictures, sounds, and videos

-> Just scoop up the media files from the outputs folder

If you want to watch something crazy and cool

-> Open and deploy the target program, an HTML5 Canvas application

# Putting it all together

Arthur programs have **three** main parts:

1. **Initialize** media variables from file names and literals and **manipulate** them as you please
2. Choreograph the **presentation** of media variables within the canvas application
3. Set up event handlers for real-time **user interaction** with the canvas application

*2 and 3 are optional, of course*

# Program structure

`void init() {...}` //initialize and manipulate  
media (backend - Java) & add it to the canvas

`void loop() {...}` //alter canvas in real-time  
(backend - JavaScript)

`void key() {...}` //make canvas react to key events

`void click() {...}` //and mouse click events

`void move() {...}` //and mouse move events!

# Language bits

```
add(media, frame optional, num optional)
```

```
//adds media object to arthur canvas
```

```
ms() // easy call to current time in ms, returns num
```

```
frame(x,y,w optional, h optional)
```

```
//add media to specific location on canvas, w/ specific size
```

```
cooler() // return a pretty random color
```

```
num * { block } // intuitive for-loop
```

# The making of arthur

meet a lot

# THE TEAM

# Translator Architecture

interpreted,, compiled,,  
and fun

Sample time

<http://kevin-roark.github.io/arthur/>

# What have we learned?

- Nothing
- Something

# Just kidding!

- The state of media encoding is a mess
- There are lots of libraries out there -- don't reinvent the wheel, make it better!!!! (*but start with the right wheel*)
- Demystification of a "compiler"
- Making stuff robust against failure is hard
- You can make whatever you want
