

# Internet Telephony for Universities

Henning Schulzrinne  
Internet Real-Time Lab  
Dept. of Computer Science  
Columbia University  
New York, New York  
schulzrinne@cs.columbia.edu

Columbia University Ivy+ Meeting

November 18, 1999

(Joint work with Jonathan Lennox, Gautam Nair, Jonathan Rosenberg, Kundan Singh, Elin Wedlund, and Jianqi Yin)

## Overview

- Internet telephony: motivation and problems
- Campus VoIP architectures
- Session Initiation Protocol (SIP)
- Internet telephony “appliances”
- Programming your telephone (service)
- Mobile services

## The phone works — why bother with VoIP?

### user perspective

- variable compression: tin can to broadcast quality
- security through encryption
- caller, talker identification
- better user interface
- internat. calls: TAT transatlantic cable = \$0.03/hr
- no local access fees (3.4c)
- easy: video, whiteboard, ...

### carrier perspective

- silence suppression  $\Rightarrow$  traffic  $\downarrow$
- shared facilities  $\Rightarrow$  management, redundancy
- advanced services (simpler than AIN and CTI)
- operational advantages
- cheaper switching
- fax as data

## The new phone companies

- separation bit carriage  $\leftrightarrow$  services
- anybody with Internet connection can provide services (ACD, 800, 900, directory, ...)
- distinction “in” vs. “out” of network not useful
- incremental start-up investment not large
- new players:
  - cable companies  $\Rightarrow$  no new infrastructure, but mostly one-way
  - electric utilities  $\Rightarrow$  need line management anyway
  - Qwest, IXC (resell to ISPs), ...

## Internet telephony services

- voice mail → email
- calendar integration
- user-programmable call processing logic
- call first available sales person (ACD)
- call whole department
- web IVR
- return web page with favorite “on hold” music

## Internet Telephony Services

- camp-on without holding a line
- short message service (“instant messaging”)
- schedule call into the future
- call with expiration date
- add/remove parties to/from call  mesh
- “buddy lists”

## Switching Costs

| Device                          | port speed     | port cost | cost/64 kb/s |
|---------------------------------|----------------|-----------|--------------|
| 8-port Ethernet hub             | 10/100 Mb/s    | 8         | 0.008        |
| 24-port Ethernet switch         | 10 Mb/s        | 55        | 0.35         |
| 8-port Ethernet switch          | 100 Mb/s fiber | 474       | 0.30         |
| 8-port Ethernet switch          | 1 Gb/s         | 1187      | 0.08         |
| 24×100BaseT + GigE              | 10/100 Mb/s    | 141       | 0.09         |
| 100 T1 circuit switch           | 1.5 Mb/s       | 25,000    | 1041         |
| 5ESS local (no AIN), 5000 lines | 64 kb/s        | 300       | 300          |
| 5ESS local (AIN), 20,000 lines  | 64 kb/s        | 175       | 175          |
| Small PBX (few hundred lines)   | 64 kb/s        | 1,000     | 1,000        |
| Large PBX (> 5000 lines)        | 64 kb/s        | 500       | 500          |

# Telephone Costs

## Transport Costs

| network                                 | \$/min    | \$/MB       |
|---|-----------|-------------|
| wholesale telephone                     | 0.01–0.02 |             |
| U.S. domestic interstate consumer rates | 0.05–0.15 |             |
| U.S. domestic intrastate consumer rates | 0.05–0.25 |             |
| modem                                   |           | 0.25 – 0.50 |
| private line                            |           | 0.50 – 1.00 |
| frame relay                             |           | 0.30        |
| MCI frame SVC                           |           | 0.05        |
| Internet                                |           | 0.04 – 0.15 |
| Internet modem                          |           | 0.33        |
| Internet backbone                       |           | 0.01        |

1' voice = 480 kB w/silence suppr., 1 MB without

## Phone Usage

“Free” phone calls does not mean unbounded increase:

| year | lines<br>(millions) | local calls<br>min/day/line | local calls<br>min/day/person |
|------|---------------------|-----------------------------|-------------------------------|
| 1980 | 102.2               | 39                          | 17.5                          |
| 1988 | 127.1               | 39                          | 20.2                          |
| 1996 | 166.3               | 40                          | 25.1                          |

## Why Aren't We Using It Now?

Internet capacity  $\ll$  phone traffic:

|                             |     |      |                    |     |      |
|-----------------------------|-----|------|--------------------|-----|------|
| world phone traffic         | 600 | Gb/s | U.S. total         | 368 | Gb/s |
| international traffic       | 13  | Gb/s | U.S. interstate    | 55  | Gb/s |
|                             |     |      | AT&T long distance | 61  | Gb/s |
| public Internet (late 1997) | 75  | Gb/s |                    |     |      |

- unpredictable sound quality, reliability
- doesn't work well for dial-up users
- no cheap Internet devices
- 640 M phone lines, 122 M in U.S.  $\Rightarrow$  gateways
- no billing infrastructure

## Projections

- MCI: “80% data, 20% voice”
- “AT&T could lose \$350 million in international calls by 2001”
- “By 2002, the Internet could account for 11% of U.S. and international long-distance voice traffic”
- “Up to 10% of the world’s fax market, which generates \$45 billion in telecom revenue a year, will move to Internet in 2 or 3 years”
- May 1999: BT builds IP phone network in Spain
- but: cable modems only 250,000 to 275,000 users in US, 10% of Internet users by 2000

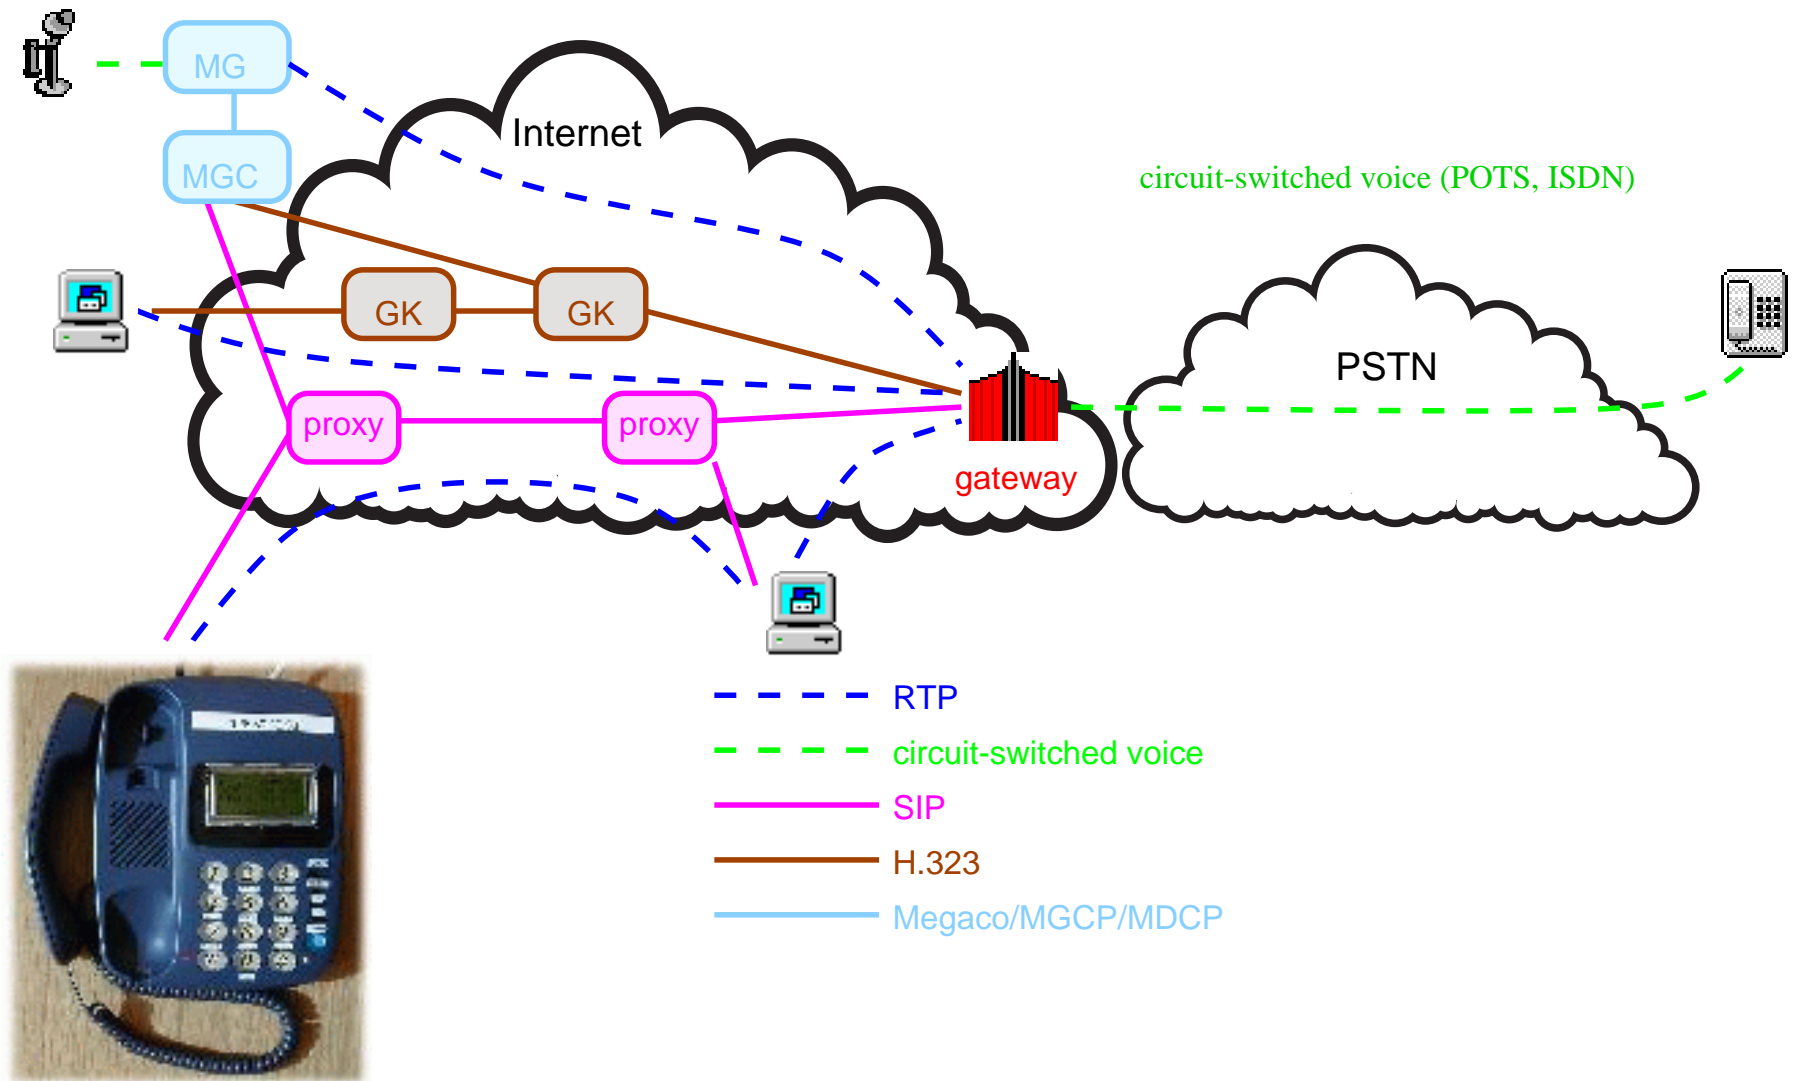

## Data vs. Voice Traffic

## Why on Campus?

- PBX nearing end of useful life, capacity
- dorm rooms, offices already wired with Cat-3/5
- backbone high-speed data capacity (20,000 users at 0.1 Erlang → 128 Mb/s, but not all calls are across campus)
- no latency issues
- video, data sharing
- re-use data connections as tie-lines to satellite campuses, dorms, faculty housing, . . .

# Internet Telephony Architecture

# Campus Data Architecture

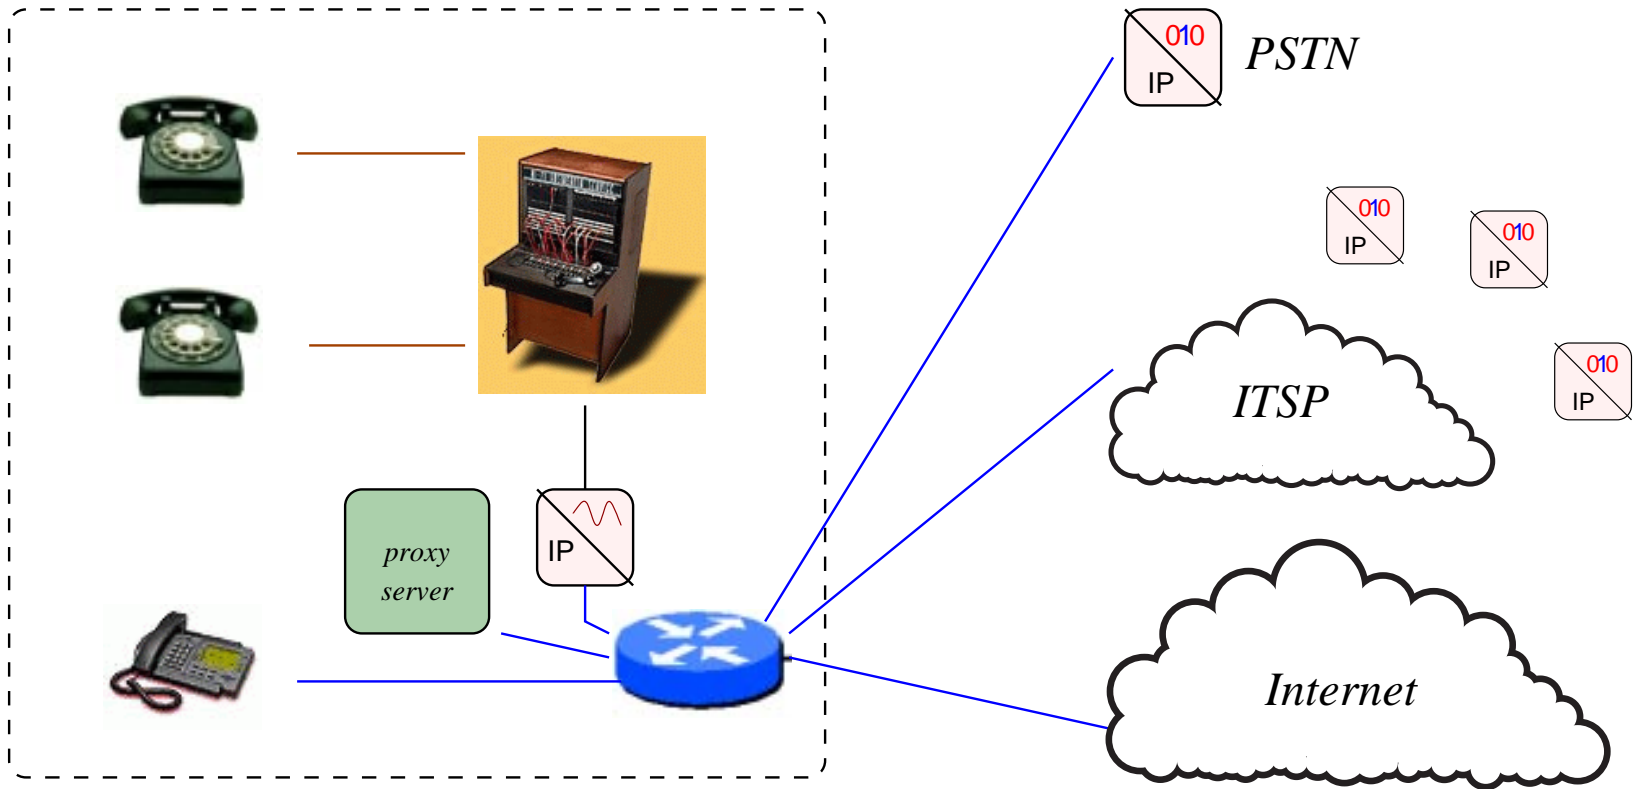

## Architecture Options

- separate wiring vs. same network
- stimulus control vs. intelligent end systems
- IP Centrex vs. external PSTN interface

# A Campus VoIP Architecture

## Separate Wiring

- re-use CAT3 wiring → just requires centralized changes
- but: distance limitation of 100–150 m
- power requirements:

|                       |        |
|-----------------------|--------|
| Etherphones           | 3–6 W  |
| Wireless access point | 4-11 W |
| Ethercams             | 8-11 W |
| Ethernet hub          | 30 W?  |
- powering for end systems and hubs:
  - local battery
  - Ethernet powering

## Ethernet Power

Ethernet cable (802.3 working group):

- phantom powered on 3/6, 1/2
- idle wires (4/5 and/or 7/8)
- automatic recognition of powered devices

Do all systems need to be powered?

## Architecture for 20,000 Lines

## Stimulus Control vs. Intelligent End Systems

|                      | stimulus      | end system                 |
|----------------------|---------------|----------------------------|
| protocol             | MGCP          | SIP, H.323                 |
| > 1 service provider | no            | yes                        |
| new services         | upgrade MGC   | proxy, end system software |
| user interface       | like phone    | more state information     |
| scaling              | single server | distributed                |
| simple devices       | yes           | SIP: yes, H.323: ?         |

## Quality of Service

- codecs can be same or better than POTS
- primarily, delay:

**audio encoding/decoding:** look-ahead, block (20-50 ms)

**application:** non-adaptive playout buffers

**end system:** operating system, sound card (buffer)

**propagation:**  $5 \mu\text{s}/\text{km}$

**queueing:** depends on congestion

**transmission:** line speed; insignificant for  $\geq \text{T1}$

## Delay

- ITU.T delay target < 150 ms
- average vs. peaks!
- avg. US *round-trip* (UUnet, Oct. 1999): 45.49 ms
- Miami – Seattle (CWI, Nov. 1999): 92.4 ms
