# 1. Introduction

Turtle Tango (TT) is a line-drawing language that uses audio input to modulate graphical output.

For a generation of programmers, Logo and turtle graphics provided a simple yet seductive introduction to writing code. By situating ourselves in the position of our friendly triangular Turtle, we envisioned the instructions required in order to induce the "motion" that created on-screen drawings. Given marching instructions and a pen pressed down, Turtle could draw for us whatever our sprouting CS-minds imagined.

TT nostalgically revisits a subset of turtle graphics in order to provide a learning vehicle for language and compiler design and implementation. To add novelty, deepen the project challenge, and inspire inventive graphical representations of music, TT augments Turtle's traditional trot by affording him the capacity to modify his strict response to marching command; the programmer can allow him some frivolity on the way to his destination by modifying his step in accordance to audio input. Turtle can tango to his favorite tunes.

Serving the role of the relative cursor, Turtle follows programming instructions and the modulations of a program's associated Tune to generate a PostScript representation of the specified dance in his world, the Disco. Although the applications for this language remain limited, the programmer retains the freedom to direct both Turtle's stride and his Tune in order to create intriguing graphical representations of music. The technically-oriented musician can leverage TT to visualize his compositions while gaining insight in how to refine troublesome phrases. Thinking graphically may even inspire the desire to explore otherwise unconsidered musical techniques, leading to innovative creations unfathomed. Conversely, the technically-oriented graphic artist can leverage TT to incorporate structured axes of freedom into the regular patterns of line drawing. With the ability to augment his diagram with any Tune, he can explore the effects of various musical styles upon his artwork, thereby gaining insight into the relationship between his design, the music, and their symbiotic representation.

Perhaps most beneficially, TT maintains the spirit of Logo by empowering the novice programmer with the ability to type a dozen commands to produce an interesting drawing. The core syntax strays little from many imperative languages, and thus provides an appropriate introduction to future language learning. The addition of the musical analysis toolset provides an extra mode of seduction through which TT can lure the reluctant programmer. And the lure holds for the novice compiler programmer, as well; the graphical reward helps motivate the grind through the detailed work needed to construct and stabilize the translation system. By combining simplicity and familiarity while enabling comparative media creativity, Turtle Tango can help seduce the next generation of students so that in-demand CS-minds can thrive in the programming career dance.

## 2. Language Tutorial

### 2.1. Starting State

A meaningful TT program produces a single-page line diagram viewable in a PostScript viewer. The coordinate system ranges from the lower-left corner at (0, 24) and increases rightward and upward to the bounds of the page: (612, 742). At start, the Disco is white, and Turtle is in the lower-left corner at (0,24) pointing to the right 0 degrees with rate 1. The Pen is width 1, solid, and is black and down. The Tune is cued to sample 0 and is paused at volume

1. Turtle is ready to tango, but his path will only appear if, at the end of a sequence of instructions, his Pen is set to Up to mark the completion of this portion of his dance.

To create a PostScript drawing the programmer must compose at minimum a main routine, save it in a .tt file, and execute the TT translator with the .tt path and the desired .wav path. A simple example follows.

## 2.2. Hi! (world) – A Simple Example

The Hello World program in the Turtle Tango universe is a depiction of Turtle’s dance to the tune of a trumpet along a “Hi!” path. The code first declares a local variable `height` which we will use for the maximum height of our letters. Next Turtle is positioned with Pen Up to a good start location. We start the music in the Disco with the call to `play` and then have Turtle dance in the shape of an “H”, and “i”, and a “!” before lifting his pen. The code listing and resulting PostScript image follow.

```
/* hi1.tt */

routine main
{
  int height;
  height = 400;

/* move to starting position */
  pu~;
  lt->45|;
  fd->250|;
  lt->45|;
  setLineWidth->3|;

/* start up the tune in the Disco */
  play~;

/* H */
  pd~;
  fd->height|;
  pu~;
  bk-> height/2 |;
  pd~;
  rt->90|;
  fd->100|;
  pu~;
  lt->90|;
  fd-> height/2 |;
  pd~;
  bk->height|;

  pu~;
  rt->90|;
  fd->50|;
  lt->90|;
```

```

/* I */
pd~;
fd-> height-150 |;
pu~;
fd->10|;
setLineWidth-> 5|;
pd~;
fd->10|;
pu~;

setLineWidth-> 3|;
rt->90|;
fd->50|;
lt->90|;
fd->100|;

/* ! */
pd~;
rt->90|;
fd->100|;
rt->99|;
fd-> height-100 |;
rt->161|;
fd-> height-100 |;
pu~;
bk-> height-100 |;
setOrientation->270|;
fd->10|;
setLineWidth->15|;
pd~;
fd->30|;
pu~;
}

```

### 2.3. Compiling and Running TT Files

Compiling a TT program requires a .tt program, a .wav audio file, and the tt compiler. Output should be directed to a specified PostScript output file. An example invocation from the Cygwin command prompt is:

```
./tt in.wav < in.tt > out.ps
```

The generated out.ps file can be opened in a PostScript viewer, or alternatively, printed.

## 2.4. Addition Examples

The first Hi! program can be extended to demonstrate the ease with which TT allows even simple drawing specification to transition toward creative abstraction. In the following code listing, the instructions to draw the “H” and the “i” have been factored into routines, and factored once more into a single “Hi” routine. Four Hi’s are then drawn along a diagonal from lower left to upper right with varying properties as Turtle continues to Tango to a trumpet. The once crisp lettering becomes a form reusable as a component in subsequent, free-form dances.

```
/* hi2.tt */

routine main
{
  int i;
  int height;
  height = 142;

  pu~;
  fd->5|;
  lt->90|;
  fd->5|;

  play~;

/* draw 5 Hi's in up-right diagonal with varying properties */
for(i=1; i<5; i = i+1)
{
  setRate-> i*2|;
  setLineWidth->i|;
  setDash-> i*2, i*2|;
  setColor-> 10*i, 35*i, 45*i|;
  setVolume-> 6-i |;
  drawHi->height|;
  pu~;
  rt->90|;
  fd->50|;
  lt->90|;
  fd-> height+10 |;
}
}

/* H */
routine drawH h
{
  pd~;
  fd->h|;
  pu~;
  bk-> h/2 |;
  pd~;
  rt->90|;
  fd-> h/4 |;
  pu~;
  lt->90|;
}
```

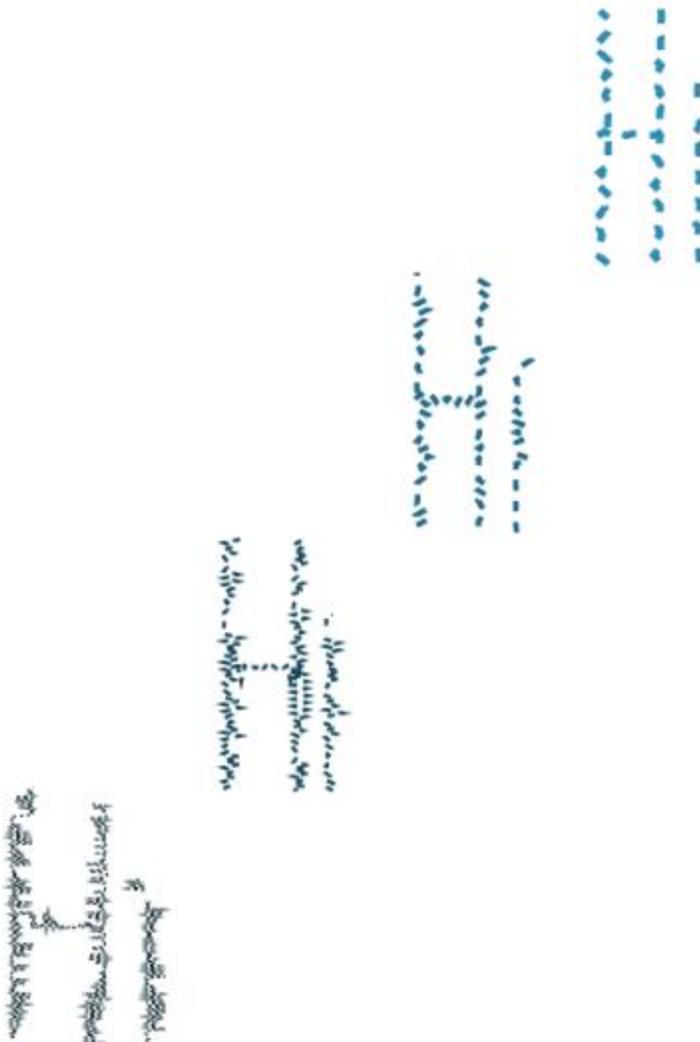

```

fd-> h/2 |;
pd~;
bk->h|;
}

/* i */
routine drawi h
{
pd~;
fd-> h * 5 / 8 |;
pu~;
fd-> 2 * (h/100) + 4 |;
pd~;
fd-> 2 * (h/100) + 4 |;
pu~;
}

routine drawHi h
{
drawH->h|;
pu~;
rt->90|;
fd-> h/6 |;
lt->90|;
drawi->h|;
bk-> h * 5/ 8 + 4 * (h/100) + 8|;
}

```

The first Hi! program also provides a useful starting point to demonstrate the last features of TT not yet explored. In the code listing below, for purpose of instruction, a global variable is declared to track the sample index, but it is recommended that a variable such as this one usually be declared locally. The Tune is cued to start at sample 1000. Out of the first 10000 samples, only groups of 42 are allowed to pass; the remaining samples are set to 0. The resulting PostScript image, also below, now resembles the form of a circuit diagram. Turtle Tango allows the technically-oriented artist to explore form quickly to encounter satisfying and sometimes surprising creations.

```

/* hi3.tt */

int sIndex; /* sample index */

routine main
{
  int i;
  int j;
  int height;
  sIndex=0;
  height = 400;

  /* cue the Tune to sample 1000 */
  cue->1000|;

  /* allow groups of 42 samples out of the first 10000 to pass unfiltered */
  for(i=1000; i < 10000; i=i+1)
  {
    sIndex = sIndex+1;
    if(sIndex == 42)
    {
      sIndex = 1;
      for(j=0; j<100; j=j+1)
      {
        setSample-> i+j, 0|;
      }
      i=i+j;
    }
  }

  /* move to starting position */
  setDiscoColor->0,190,0|;
  setColor->255,255,255|;
  pu~;
  lt->45|;
  fd->250|;
  lt->45|;
  setLineWidth->3|;

  /* start up the tune in the Disco */
  play~;

  /* H */
  pd~;
  fd->height|;
  pu~;
  bk-> height/2 |;
  pd~;
  rt->90|;
  fd->100|;
  pu~;
  lt->90|;
  fd-> height/2 |;

```

```

pd~;
bk->height|;

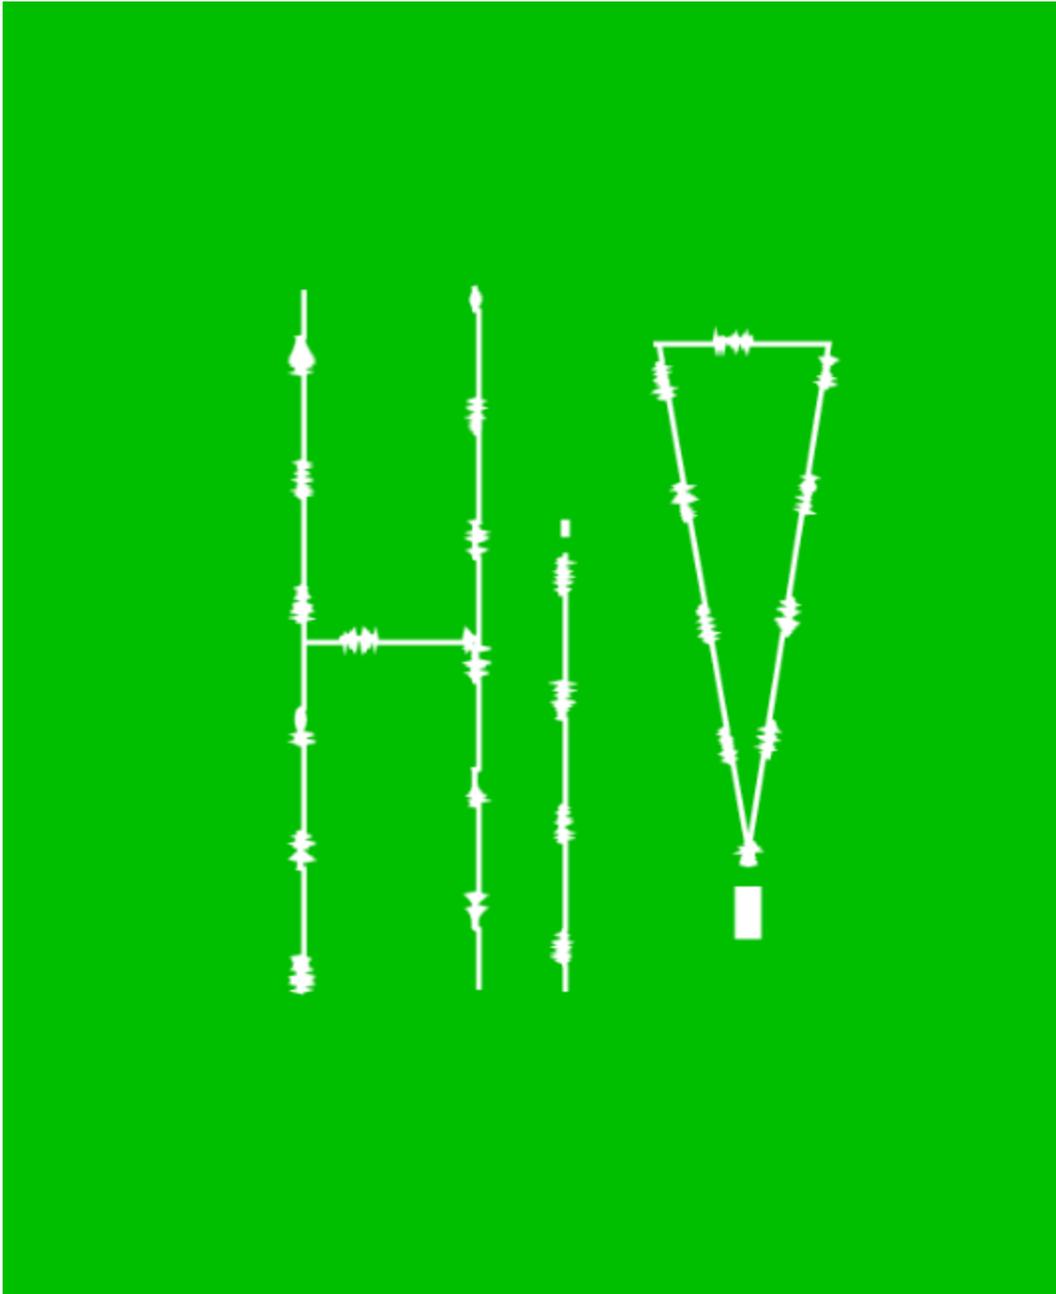

pu~;
rt->90|;
fd->50|;
lt->90|;

/* I */
pd~;
fd-> height-150 |;
pu~;
fd->10|;
setLineWidth-> 5|;
pd~;
fd->10|;
pu~;

setLineWidth-> 3|;
rt->90|;
fd->50|;
lt->90|;
fd->100|;

/* ! */
pd~;
rt->90|;
fd->100|;
rt->99|;
fd-> height-100 |;
rt->161|;
fd-> height-100 |;
pu~;
bk-> height-100 |;
setOrientation->270|;
fd->10|;
setLineWidth->15|;
pd~;
fd->30|;
pu~;
}

```

## 3. Language Reference Manual

### 3.1. Introduction

A TT program consists of variable and routine declarations composed in a text file with a .tt extension. Control initiates in the `main` routine, which accepts a command-line file path argument pointing to .wav audio input. The output of compilation is a PostScript file with extension .ps depicting Turtle's dance in graphical form when viewed in a PostScript viewer.

## 3.2. Lexical Conventions

### 3.2.1. Tokens

The five classes of tokens are identifiers, keywords, constants, operators, and separators. Whitespace is ignored; TT is free-format.

### 3.2.2. Comments

The sequence `'/*'` begins a comment, which ends with the sequence `'*/'`.

### 3.2.3. Identifiers

An identifier is a sequence of letters `'a'-'z'` and `'A'-'Z'` and digits `'0'-'9'` and `'_'`. Identifiers are case-sensitive, e.g. `'a'` is not the same as `'A'`.

### 3.2.4. Keywords

The following keywords are reserved:

```
int, routine, return, if, else, for, while, print
setDiscoColor, setColor, setDash, setLineWidth
fd, bk, lt, rt, pu, pd
setPosition, setOrientation, getOrientation, setRate
cue, pause, play, stop, setVolume
getTuneLength, getSample, setSample
```

### 3.2.5. Constants

Constants are integers consisting of a sequence of digits `'0'-'9'`.

## 3.3. Scope

Variable and routines are statically scoped.

Both global and local variable declarations are allowed; within a routine, local variables and formal parameters must have unique names. Local variables can only be accessed within the routine in which they are declared, and cannot be accessed before declared.

Routines must have globally unique names and cannot be declared within other routines. A routine can be called before it is declared.

## 3.4. Statements

Statements are executed in sequence unless otherwise noted.

### 3.4.1. Expression

Expressions are described in detail in section 5. An expression statement consists of an expression followed by `';'`.

### 3.4.2. Compound

A compound statement allows several statements to be used in places in which one statement is expected, but more are needed. It consists of a ' {' followed by zero or more statements and a closing ' } '.

### 3.4.3. Conditional

Conditional expressions take one of two forms:

```
if (expression) statement
if (expression) statement else statement
```

The expression is first evaluated. Any resulting value other than zero is considered true, and the following statement is executed. If the expression evaluates to zero, in the first conditional form, the statement is skipped; in the second conditional form, the statement following the `else` is executed. `else` binds to the most recent `if` not associated with another `else`.

### 3.4.4. Loop

#### 3.4.4.1. For

The `for` statement has one form:

```
for (expression1; expression2; expression3) statement
```

`expression1` specifies loop initialization. `expression2` specifies a test, executed before each iteration, that evaluates to 0 to signal that the loop should exit. `expression3` usually mutates a variable declared in `expression1`, so that `expression2` eventually evaluates to 0. However, none of the three expressions is required. If `expression2` is empty, the loop iterates until the `break` statement is executed.

#### 3.4.4.2. While

The `while` statement has one form:

```
while (expression) statement
```

The expression is evaluated once before each of zero or more iterations. If the expression evaluates to zero the loop terminates; otherwise, the statement is executed, followed again by the expression.

### 3.4.5. Return

A routine can terminate execution and return to its caller with the `return` statement, which has two forms:

```
return;
return expression;
```

When the expression is omitted, zero is returned.

## 3.5. Statements

Expressions are left-associative unless otherwise specified.

### 3.5.1. Constants

Integer constants are valid expressions.

### 3.5.2. Variables

A variable is accessed by specifying its identifier, which is a valid expression.

### 3.5.3. Unary Operators

The unary operator ' - ' negates its right-associated expression.

### 3.5.4. Binary Operators

The following binary operators are listed from highest to lowest precedence.

#### 3.5.4.1. Multiplicative

' \* ' indicates: multiplication.

' / ' indicates: division.

#### 3.5.4.2. Additive

' + ' indicates: addition.

' - ' indicates: subtraction.

#### 3.5.4.3. Relational and Equality

The relational and equality operators return 1 when true and 0 when false.

' < ' indicates: less than.

' > ' indicates: greater than.

' <= ' indicates: less than or equal.

' >= ' indicates: greater than or equal.

' == ' indicates: equal.

' != ' indicates: not equal.

### 3.5.5. Assignment

' = ' indicates: assignment. It is used to assign an integer variable or constant to a variable, and is right-associative.

### 3.5.6. Routine Calls

A routine without parameters is called by specifying its identifier, followed by a '~'. A routine with parameters is called by specifying its identifier, the characters '->', a comma-separated list of arguments, and the character '|'. The number of the arguments in the comma-separated list must match the routine declaration.

```
pd~;  
fd-> 10|;
```

### 3.6. Statements

A variable declaration has one form:

```
int identifier;
```

The keyword `int` prefixes a variable declaration, and a semi-colon follows the identifier. Variables contain the value zero when first declared.

### 3.7. Routine Declarations

A routine declaration has the form:

```
routine identifier arg1, arg2, ..., argN  
{ variable declarations and statements }
```

The keyword `routine` is followed by an optional comma-separated list of arguments. A mandatory opening brace then begins a series of zero or more variable declarations and statements, followed by a closing brace.

All variables specified in the argument list are accessible as local variables; these variable names remain unique within the scope of the routine. The main routine transparently requires one argument, the `FilePath` used to initiate this program's Tune.

### 3.8. Built-in Routines

#### 3.8.1. Disco

```
setDiscoColor-> r,b,g|
```

Sets the background color to the `r,b,g` value specified; `r,b,g` range from 0-255. . The Disco starts with value `1,1,1`.

#### 3.8.2. Turtle

```
fd-> x|, bk-> x|
```

Turtle moves forward or back positive `x` steps while drawing if Pen is down.

```
lt-> d|, rt-> d|
```

Turtle turns left or right positive `d` degrees.

```
setPosition-> x,y|
```

Turtle jumps to the position `x,y` without drawing. Turtle starts at position `0,24`.

```
getOrientation~
```

Retrieves Turtle's orientation in degrees. Turtle starts with orientation `0`.

```
setOrientation-> d|
```

Turtle turns to point in the direction of `d` degrees.

```
setRate-> r|
```

Sets Turtle's rate of movement to `r`. Turtle starts with rate `1`.

### 3.8.3. Pen

`pu~`, `pd~`

Sets the Pen Up, Down. Turtle starts with Pen Down.

`setColor`-> `r,b,g` |

Sets the Pen's color to the `r,b,g` value specified; `r,b,g` range from 0-255. The Pen starts with value 0,0,0.

`setDash`-> `d,s` |

Sets the Pen to output strides of length `d` followed by space of size `s`. The Pen starts with value 1,0 to specify a solid line.

`setLineWidth`-> `w` |

Sets the Pen's Width to `w`. The Pen starts with value 1.

### 3.8.4. Tune

`cue`-> `s` |

Sets the sample index of the Tune. The Tune starts at sample 0.

`pause~`

Pauses the Tune in the Disco.

`play~`

Resumes play of the Tune in the Disco. The Tune is looped if play reaches the end.

`setVolume`-> `v` |

Sets the volume of the Tune to `v`. The Tune starts at volume 1.

`getTuneLength~`

Gets the number of samples in the Tune.

`getSample`-> `i` |

Gets the sample value at index `i`.

`setSample`-> `i,s` |

Sets the sample value at index `i` to `s`.

## 4. Project Plan

### 4.1. Process

The processes used for planning, specification, development, and testing each centered upon a bias for action. Planning was frequently set aside so that development experiments could assist in determining reasonable project scope. More broadly, though, planning proved critical for motivating the allocation of a sufficient quantity of time to establish a functional development environment; naiveté in the realms of Cygwin, Simple DirectMedia Layer, OCaml, and PostScript led to time-consuming confusion during efforts to isolate disconnects.

Specification required researching the PostScript language in order to determine the appropriate subset of instructions, as well as their proper orderings, needed to translate a TT program. Further inquiry into SDL and OCaml's Bigarray module allowed for the finalization of the LRM.

The development process unfolded in three distinct phases. The first phase focused on the revision of the MicroC syntax to the one used by TT; since the languages are quite similar, the example implantation proved extremely valuable. Overcoming shift/reduce errors emerged as the primary concern during this phase. The second phase involved constructing the mechanisms to output sequences of PostScript instructions that resulted in intended drawings. Primary challenges in this phase included determining how to maintain state of the graphical properties, and of course, of the relative cursor, Turtle. The third and final phase of development required digging into the Audio library to uncover how to manipulate audio input. Printing the value of a single sample from audio input proved an overdue but inspirational milestone; accurately defining trigonometric calculations for Turtle's movements led to some entertaining graphical manifestations.

Testing similarly proceeded in three phases and is discussed in greater detail in Section 6. A revised version of the test suite from MicroC established the validity of phase one development. The second phase required substantial visual inspection of the generated output PostScript files to confirm all operations rendered as intended. The third phase required significant tuning to ensure that audio modulation of drawings resulted in decipherable and interesting augmentations.

## 4.2. Style Guide

TT is free-form and thus does not explicitly demand a particular programming style. The recommended approach is to compose a TT program in a .tt text file. Global variables are defined at the top of the page. The main routine is defined first so that the entry point is immediately apparent to the reader. All other routines can be defined in any order, but the programmer should gather them into logical groupings. Indentation is optional but preferable for readability.

Readability is further improved by adding adequate spacing in routine calls. Generally, spacing should increase with the complexity of the arguments. For example:

```
foo->42|;
```

is quite readable, but

```
foo->42,bar->80,30,4*5|,fubu~|;
```

could be more legible if written as:

```
foo-> 42,  bar-> 80, 30, 4*5|,  fubu~|;
```

or:

```
foo-> 42,  
    bar-> 80, 30, 4*5|,  
    fubu~|;
```

No further convention is specified, and the TT programmer retains discretion to format as desired. The intention of this minimal guidance is to allow the novice programmer to explore and develop personal preferences for modes of expression, and to allow the experienced programmer to apply practice used when writing in other languages in this domain.

### 4.3. Timeline

The table below contains the planned project timeline.

6/6/2012	Project Proposal
6/27/2012	Language Reference Manual
7/8/2012	PostScript & Audio library research complete
7/15/2012	Development environment functional
7/22/2012	Final Scanner, Parser, Ast complete
7/29/2012	Hello World PostScript code generation
8/5/2012	PostScript code generation without audio
8/12/2012	PostScript code generation with audio
8/17/2012	Project Report

### 4.4. Software Development Environment

An unfortunate encounter with Boston's momentary monsoon season this July led to a transition of development environment midway through the project. Initial explorations used a 32-bit Windows XP notebook running a Windows OCaml compiler. The majority of the development has proceeded using a 64-bit Windows 7 machine running a Cygwin OCaml compiler. Installing a library that successfully loaded a .wav file in OCaml in this environment presented a surprisingly frustrating challenge, but once configured, development proceeded without interruptions. With minor adjustments, the Makefile included in the MicroC example proved very useful for keeping the build sequence simple and manageable. For reference, information about the audio library can be found here: <http://glcaml.sourceforge.net>.

### 4.5. Project Log

The table below contains the actual dates of project milestones.

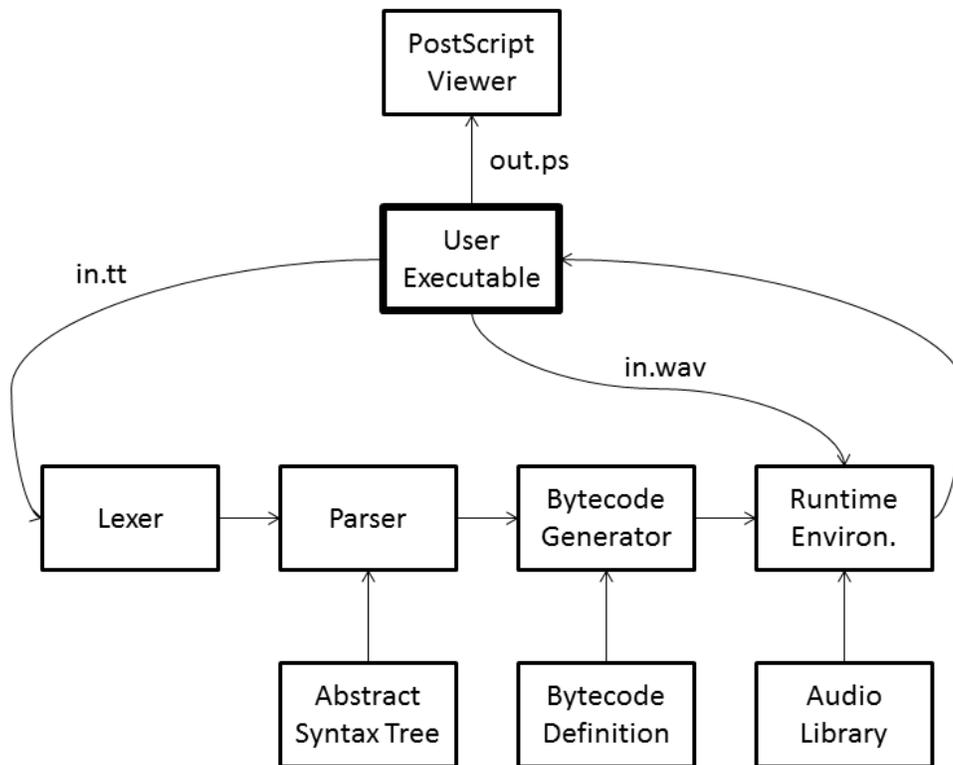

5/26/2012	Project started – researching language ideas
6/6/2012	Project Proposal
6/17/2012	Initial grammar specified
6/24/2012	Initial Scanner, Parser, Ast complete
6/29/2012	Language Reference Manual
7/10/2012	PostScript and Audio library research complete
7/24/2012	Development environment functional
7/27/2012	Final Scanner, Parser, Ast complete
7/31/2012	Basic code generator complete; Testing phase 1 complete
8/2/2012	Hello World PostScript code generation
8/8/2012	PostScript code generation without audio; Testing phase 2 complete
8/15/2012	PostScript code generation with audio; Testing phase 3 complete
8/20/2012	Project Report

## 5. Architectural Design

### 5.1. Architecture

The Turtle Tango compiler and runtime environment adhere very closely to the architecture of the MicroC example provided. The only component removed is the interpreter; the TT system offers the capability solely to compile into a stack-based bytecode and execute in OCaml. The resulting output of a meaningful, compiled TT program is a set of PostScript instructions depicting an image when opened in a PostScript viewer.

The system consists of eight modules as depicted in the figure below: Lexical Analyzer (scanner.ml), Syntax/Semantic Analyzer (parser.ml), Abstract Syntax Tree (ast.ml), Bytecode Definition (bytecode.ml), Audio Library (sdl.ml, sdl\_stub.c), Bytecode Generator (compile.ml), Runtime Environment (execute.ml), and User Executable (tt.ml).

### 5.2. Module Interfaces

The entry point of the compiler is the User Executable, which directs program control to the let statement marked `main`. Here, the lexer is invoked and interfaces with standard input by scanning TT code written in a `.tt` file. It divides this input into a set of valid tokens, and provides them as input to the parser's `program` function. This function constructs a syntactically and semantically sensible representation of the written code by building the

abstract syntax tree's declaration of `program` (`Ast.program`); if such a construction is not feasible, the parser interfaces with standard out by returning a Parse Error.

This organized list of program components is provided to the bytecode generator's `Translate` function. This function translates the abstract syntax representation into a sequence of bytecode statements, using the bytecode definition; if such a translation is not possible, the bytecode generator interfaces with standard out by returning a useful error message, such as "undefined function foo". If no error has occurred, the runtime environment accepts the bytecode statements and the path to the required input .wav file as input to its `execute_prog` function. With the assistance of an open source audio library that wraps Simple DirectMedia Layer for OCaml, the execution of these bytecode statements on the simulated stack produces a series of instructions describing the PostScript representation of the compiled TT program. These statements interface with standard out as a stream, and typically are redirected to a PostScript output file (such as `out.ps`).

Finally, the PostScript viewer provides a rewarding translation of PostScript statements into a visual image.

## 6. Test Plan

### 6.1. Example Translations

Provided in Appendix B are two examples of representative source programs and the associated generated PostScript. As a good introduction, first is the PostScript listing of the Hi! (world) example. The second example, similar to the program used in the second tutorial program, instructs Turtle to dance to his favorite trumpet, and his favorite step, Hi, while tracking his x and y position at a global level, and using his position to adjust the Pen color.

### 6.2. Test Suites

The following test programs were used regularly in an automated testing pattern. The tests in the left column test each of the basic imperative language constructs. The tests in the right column test each construct that impacts the Disco, Turtle, Pen, or Tune.

test-arith1.tt	test-_setPosition.tt
test-arith2.tt	test-_setColor.tt
test-fib.tt	test-_setDiscoColor.tt
test-for1.tt	test-_setLineWidth.tt
test-func1.tt	test-_setDash.tt
test-func2.tt	test-_setOrientation.tt
test-func3.tt	test-_pd.tt
test-gcd.tt	test-_pu.tt
test-global1.tt	test-_fd.tt
test-hello.tt	test-_bk.tt
test-if1.tt	test-_rt.tt
test-if2.tt	test-_lt.tt
test-if3.tt	test-_setRate.tt
test-if4.tt	test-_play.tt
test-ops1.tt	test-_pause.tt

test-var1.tt	test-_cue.tt
test-while1.tt	test-_setVolume.tt
	test-_getTuneLength.tt
	test-_getSample.tt
	test-_setSample.tt
	test-_stack.tt
	test-_boundaries.tt

As a representative example, the contents of test-\_boundaries.tt and test-\_boundaries.out are listed below.

```
/* test-_boundaries.tt */
routine main
{

### 6.3. Test Methodology

As discussed in section 4, the test plan involved three phases. The goal of the first phase was to stabilize the basic

imperative language without PostScript output by ensuring that all tests provided in the MicroC example test suite succeeded. These tests were included in each of the subsequent phases to ensure adequate regression coverage.

The goal of the second phase was to validate that all functions producing PostScript instructions were producing the intended images prior to introducing the musical component. Drawing a simple square served as an initial important test that was later extended to the bounds of the page to discover the precise dimensions of the Disco. Other critical verifications focused on the relative cursor and positioning system; the initial implementation led to buggy drawings as a result of mishandling Turtle's movement when the Pen was up. Some dedicated stack-testing also became necessary due to initial inexact book-keeping of the stack pointer in `execute.ml`.

The goal of the third phase was to ensure that the audio modulations produced viable PostScript, rendered accurately, and produced interesting augmentations to the drawings. Although a set of tests were built for the automation process to ensure regression coverage, these tests relied primarily on inspection. The aim was to tune the system with proper constant coefficients for rates and volume so that the programmer would have an easy time using the audio samples of the input `.wav` file to create interesting Turtle Tangos.

## 6.4. Test Automation

All tests for each phase were included in the automated testing process. The architecture of this automation followed directly from the MicroC example. "Gold" `.out` files containing output inspected and verified as correct were compared with output generated during each round of tests to ensure that changes in one piece of the system did not break other components. The test suite was run frequently during development and refinement in an attempt to correlate fresh bugs with recent code changes.

## 7. Lessons Learned

The most enlightening lesson learned during the development of the TT system emerges when stepping back to review the set of choices made to construct the system. Although this effort leaned heavily on the MicroC example, the methodology to translate any set of characters in a text file into something entirely different, such as a mash-up of music and line-drawings, proves tractable. Furthermore, the infinite range of choices one can make in deciding how to translate one set of meaningful characters into another set that specifies programmatic instruction, reveals another dimension of freedom for the developer applying computer science. For example, this system could have translated TT code directly into PostScript without the bytecode intermediary; when starting the project, such a vision was difficult to perceive. Just as one programs as an act of creation when fluent in a language, one can extend this creative freedom beyond the scope of the language and into anything else. The challenge of square problems with round programming languages no longer must devolve into searches for messy compensatory libraries. The lesson is that the power to type in a text editor is the power to accomplish any programming endeavor.

## Appendix A: Turtle Tango Translator Code listing

The following code listings are presented below: `ast.ml`, `bytecode.ml`, `compile.ml`, `execute.ml`, `parser.mly`, `scanner.mll`, `sdl.ml`, `sdl_stub.c`, `tt.ml`, `testall.sh`, `Makefile`.

## ast.ml
