

# Virtuoso: Narrowing the Semantic Gap in Virtual Machine Introspection

Brendan Dolan-Gavitt<sup>\*</sup>, Tim Leek<sup>†</sup>, Michael Zhivich<sup>†</sup>, Jonathon Giffin<sup>\*</sup>, and Wenke Lee<sup>\*</sup>

\* Georgia Institute of Technology † MIT Lincoln Laboratory

#### {brendan,giffin,wenke}@cc.gatech.edu {tleek,mzhivich}@ll.mit.edu

This work was sponsored by IARPA under Air Force Contract FA8721-05-C-0002. Opinions, interpretation, conclusions and recommendations are those of the authors and are not necessarily endorsed by the United States Government.

#### Virtual Machine Introspection

#### Open Problem: The Semantic Gap

- Isolation can provide security
- Isolation makes it hard to see what's going on
- View exposed by VMM is low-level (physical memory, CPU state)
- Need to reconstruct high-level view using introspection routines

#### What You Want...

#### What You Get

Oakland 'I I

Virtuoso

#### Introspection Challenges

- Introspection routines are currently built manually
- Building routines requires detailed knowledge of OS internals
  - Often requires reverse engineering
- OS updates and patches break existing introspection utilities

Oakland 'I I

5/24/2011

#### Contributions

- We generate introspection routines automatically
- No knowledge of OS internals or reverse engineering required
- Routines can be regenerated easily for new OS versions / patches

- Generality: generate useful introspection programs on multiple operating systems
- Reliability: generate working programs using dynamic analysis
- Security: ensure that programs are unaffected by guest compromise

# Challenges

- Assume no prior knowledge of OS internals
- Code extraction must be *whole-system* 
  - Much of the code we want is in the kernel
  - Existing work (BCR, Inspector Gadget) only extracts small pieces of userland code

Virtuoso

5/24/2011

#### Whole-System Traces

- Includes all instructions between start and end markers
- Includes software and hardware interrupts and exceptions
- Includes concrete addresses of memory reads/writes

#### **Trace Analysis**

- What subset of this trace is relevant?
- Initial preprocessing:

Oakland 'I I

- Remove hardware interrupts
- Replace malloc/realloc/calloc with summary functions
- Next, executable dynamic slicing (Korel and Laski, 1988) is done to identify relevant instructions

Virtuoso

#### Executable Dynamic Slicing

- Follow data def/use chain backward, starting with output buffer
- Examine CFG and add necessary control flow statements to slice (and their dependencies)
- 3. Perform slice closure:

Oakland 'I I

 If any instance of an instruction is included in the slice, all instances of that instruction must be marked

Virtuoso

5/24/2011

# Trace Merging

- Since analysis is dynamic, we only see one path through program
- So: run program multiple times and then merge results

# Trace Merging

- Since analysis is dynamic, we only see one path through program
- So: run program multiple times and then merge results

#### **Program Translation**

- Goal: convert in-guest → out-of-guest
- Generates Python code that runs inside Volatility memory analysis framework
- Changes:
  - Memory reads come from guest VM
  - Memory writes are copy-on-write
  - CPU registers become local vars

#### **Translation Example**

#### Original x86

#### QEMU µOps

#### Python

#### Oakland 'I I

#### Virtuoso

#### 5/24/2011

#### **Results: Generality**

 Generated 6 useful introspection programs on each of 3 operating systems

#### Introspection Programs

- getpid Gets the PID of the currently running process.
- **pslist** Gets a list of PIDs of all running processes.
- getpsfile Gets the name of an executable from its PID.
- Ismod Gets the base addresses of all kernel modules.
- **getdrvfile** Gets the name of a kernel module from its base address.
- **gettime** Gets the current system time.

#### **Results: Reliability**

- Analysis is dynamic, so programs may be incomplete
- How many traces are needed to produce reliable programs?
- Complicating factors: caching, difficulty of deciding ground truth for coverage

### Windows **pslist** Reliability

**Generated Program Reliability** 

#### **Results: Security**

- Verified that introspection programs are not affected by in-guest code manipulation
- Training program (pslist) generated on clean system
- Resulting introspection program still detects processes hidden by Hacker Defender
- Note: DKOM attacks can still be effective against Virtuoso

#### Limitations

- Multiple processes/IPC
- Multithreaded code (synchronization)
- Code/data relocation (ASLR)
- Self-modifying code

#### Conclusions

- Programs generated by Virtuoso can be useful, reliable, and secure
- Uses novel whole-system executable dynamic slicing and merging
- Virtuoso can greatly reduce time and effort needed to create introspection programs
  - Weeks of reverse engineering vs. minutes of computation
