- Triangulation Examples
- Running Intersection Property
- Building a Junction Tree
- The Junction Tree Algorithm

# Triangulation Examples

- **Cycle:** A closed (simple) path, with no repeated vertices other than the starting and ending vertices
- **Chordless Cycle:** a cycle where no two non-adjacent vertices on the cycle are joined by an edge.
- **Triangulated Graph:** a graph that contains no chordless cycle of four or more vertices (aka a **Chordal Graph**).

# Triangulation Examples

# Triangulation Examples

# Triangulation Examples

# Triangulation Examples

# Triangulation Examples

# Triangulation Examples

# Running Intersection Property

- Junction Tree must satisfy **Running Intersection Property**
- RIP: On unique path connecting clique  $V$  to clique  $W$ , all other cliques share nodes in  $V \cap W$

# Running Intersection Property

- Junction Tree must satisfy **Running Intersection Property**
- RIP: On unique path connecting clique  $V$  to clique  $W$ , all other cliques share nodes in  $V \cap W$

*HINT:* Junction Tree has largest total separator cardinality

$$|\Phi| = |\phi(B, D)| + |\phi(C, D)|$$

$$= 2 + 2$$

$$|\Phi| = |\phi(C, D)| + |\phi(D)|$$

$$= 2 + 1$$

# Forming the Junction Tree

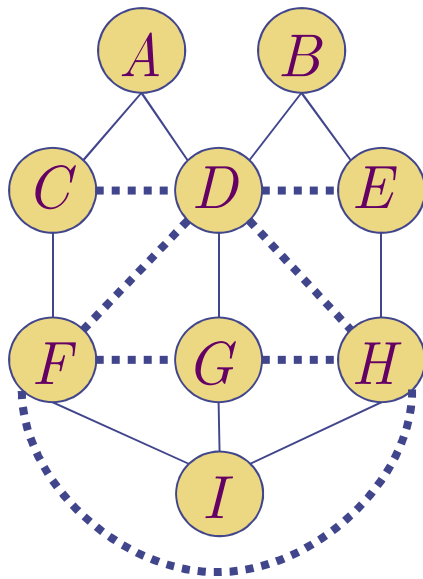

- Goal: connect  $k$  cliques into a tree...  $k^{k-2}$  possibilities!
- For each, check Running Intersection Property, too slow...
- Theorem: a valid (RIP) Junction Tree connection is one that maximizes the cardinality of the separators

$$\begin{aligned}
 JT^* &= \arg \max_{\text{TREE STRUCTURES}} |\Phi| \\
 &= \arg \max_{\text{TREE STRUCTURES}} \sum_s |\phi(X_s)|
 \end{aligned}$$

- Use very fast **Kruskal algorithm**:
  - 1) Init Tree with all cliques unconnected (no edges)
  - 2) Compute size of separators between all pairs
  - 3) Connect the two cliques with the biggest separator cardinality which doesn't create a loop in current Tree (maintains Tree structure)
  - 4) Stop when all nodes are connected, else goto 3

# Kruskal Example

- Start with unconnected cliques (after triangulation)

Connection  
with  
triangulation?

	ACD	BDE	CDF	DEH	DFGH	FGHI
ACD	-	1	2	1	1	0
BDE		-	1	2	1	0
CDF			-	1	2	1
DEH				-	2	1
DFGH					-	3
FGHI						-

# Junction Tree Probabilities

- We now have a valid Junction Tree!
- What does that mean?
- Recall probability for undirected graphs:

$$p(X) = p(x_1, \dots, x_M) = \frac{1}{Z} \prod_C \psi(X_C)$$

- Can write junction tree as potentials of its cliques:

$$p(X) = \frac{1}{Z} \prod_C \tilde{\psi}(X_C)$$

- Alternatively: clique potentials over separator potentials:

$$p(X) = \frac{1}{Z} \frac{\prod_C \psi(X_C)}{\prod_S \phi(X_S)}$$

- This doesn't change/do anything! Just less compact...
- Like *de-absorbing* smaller cliques from maximal cliques:

$$\tilde{\psi}(A, B, D) = \frac{\psi(A, B, D)}{\phi(B, D)} \quad \longleftarrow \quad \begin{array}{l} \text{...gives back} \\ \text{original} \\ \text{formula if} \end{array} \quad \phi(B, D) \triangleq 1$$

# Junction Tree Probabilities

- Can quickly converted directed graph into this form:

$$p(X) = \frac{1}{Z} \frac{\prod_C \psi(X_C)}{\prod_S \phi(X_S)}$$

- Example:

$$p(X) = p(x_1)p(x_2 | x_1)p(x_3 | x_2)p(x_4 | x_3)$$

$$\begin{aligned} p(X) &= \frac{1}{1} \frac{p(x_1, x_2)p(x_3 | x_2)p(x_4 | x_3)}{1 \times 1} \\ &= \frac{1}{Z} \frac{\psi(x_1, x_2)\psi(x_2, x_3)\psi(x_3, x_4)}{\phi(x_2)\phi(x_3)} \end{aligned}$$

**By inspection, can just cut & paste CPTs as cliques and add separator potential functions**

# Junction Tree Algorithm

- Running the JTA converts clique potentials & separator potentials into marginals over their variables ... and does not change  $p(X)$

$$\psi(A, B, D) \rightarrow p(A, B, D)$$

$$\phi(B, D) \rightarrow p(B, D)$$

$$\psi(B, C, D) \rightarrow p(B, C, D)$$

- Don't want just normalization!

$$\frac{\psi(A, B, D)}{\sum_{A, B, D} \psi(A, B, D)} \neq p(A, B, D)$$

- These marginals should all agree & be **consistent**

$$\begin{array}{l} \psi(A, B, D) \rightarrow p(A, B, D) \quad \rightarrow \sum_A p(A, B, D) = \tilde{p}(B, D) \\ \phi(B, D) \rightarrow p(B, D) \quad \rightarrow p(B, D) \\ \psi(B, C, D) \rightarrow p(B, C, D) \quad \rightarrow \sum_C p(B, C, D) = \tilde{\tilde{p}}(B, D) \end{array}$$

**ALL EQUAL**

- Consistency: all distributions agree on submarginals
- JTA sends messages between cliques & separators dividing each by the others marginals until consistency...

# Junction Tree Algorithm

- Send message from each clique *to* its separators of what it thinks the submarginal on the separator is.
- Normalize each clique by incoming message *from* its separators so it agrees with them

**If agree:**  $\sum_{V \setminus S} \psi_V = \phi_S = p(S) = \phi_S = \sum_{W \setminus S} \psi_W$  **...Done!**

**Else: Send message  
From V to W...**

$$\begin{aligned} \phi_S^* &= \sum_{V \setminus S} \psi_V \\ \psi_W^* &= \frac{\phi_S^*}{\phi_S} \psi_W \\ \psi_V^* &= \psi_V \end{aligned}$$

**Send message  
From W to V...**

$$\begin{aligned} \phi_S^{**} &= \sum_{W \setminus S} \psi_W^* \\ \psi_V^{**} &= \frac{\phi_S^{**}}{\phi_S^*} \psi_V^* \\ \psi_W^{**} &= \psi_W^* \end{aligned}$$

**Now they  
Agree...Done!**

$$\begin{aligned} \sum_{V \setminus S} \psi_V^{**} &= \sum_{V \setminus S} \frac{\phi_S^{**}}{\phi_S^*} \psi_V^* \\ &= \frac{\phi_S^{**}}{\phi_S^*} \sum_{V \setminus S} \psi_V^* \\ &= \phi_S^{**} = \sum_{W \setminus S} \psi_W^{**} \end{aligned}$$

# Junction Tree Algorithm

- When “Done”, all clique potentials are marginals and all separator potentials are submarginals!
- Note that  $p(X)$  is unchanged by message passing step:

$$\begin{aligned}\phi_S^* &= \sum_{V \setminus S} \psi_V \\ \psi_W^* &= \frac{\phi_S^*}{\phi_S} \psi_W \\ \psi_V^* &= \psi_V\end{aligned}$$

$$p(X) = \frac{1}{Z} \frac{\psi_V^* \psi_W^*}{\phi_S^*} = \frac{1}{Z} \frac{\psi_V \frac{\phi_S^*}{\phi_S} \psi_W}{\phi_S^*} = \frac{1}{Z} \frac{\psi_V \psi_W}{\phi_S}$$

- Potentials set to conditionals (or slices) become marginals!

$$\begin{aligned}\psi_{AB} &= p(B | A)p(A) \\ &= p(A, B)\end{aligned}$$

$$\longrightarrow \phi_B^* = \sum_A \psi_{AB} = \sum_A p(A, B) = p(B)$$

$$\psi_{BC} = p(C | B)$$

$$\longrightarrow \psi_{BC}^* = \frac{\phi_S^*}{\phi_S} \psi_{BC} = \frac{p(B)}{1} p(C | B) = p(B, C)$$

$$\phi_B = 1$$
