

# Overview of machine learning

COMS 4771 Fall 2025

Problem: Create a program that, given a pair of input colors (e.g., blue, yellow), returns the color observed when the input colors are mixed together.

(blue, yellow)  $\mapsto$  green

Problem: Create a program that, given an image of a bird, returns the name of the bird species

"Peregrine falcon"

2 / 15

Problem: Create a program that, given a Netflix user and a movie, returns the rating that the user would give to the movie

\*\*\*\*

3 / 15

Problem: Create a program that, given a sentence written in English, returns the French translation

4 / 15

Problem: Create a program that, given a list of numbers, returns a list of the same numbers in sorted order

$(29, 31, 67, 43, 21, 30, 96) \longrightarrow (21, 29, 30, 31, 43, 67, 96)$

5 / 15

Problem: Create a program that, **given no input at all**, returns the outcome of a fair coin toss **that you will perform after the program completes**.

"heads"

6 / 15

► Which of these problems could you solve "by hand"?

► Which of these problems could be solved at all?

7 / 15

## Basic pipeline for (supervised) machine learning

- ▶ Step 1. Collect [training data](#)—collection of input/output pairs
- ▶ Step 2. Decide how to represent inputs ([feature engineering](#)) and the general “template” of the program ([model selection](#))
- ▶ Step 3. [Learning algorithm](#) “fills-in” the template using data
- ▶ Step 4. Get additional [test data](#)—more input/output pairs
- ▶ Step 5. Evaluate program on the test data

8 / 15

[Feature engineering](#): how will the input be provided to the program?

- ▶ Netflix movie rating:
- ▶ Spam filtering:

[Model selection](#): what is the general “template” of the program?

9 / 15

**Require:** age, gender, genre, release year, title

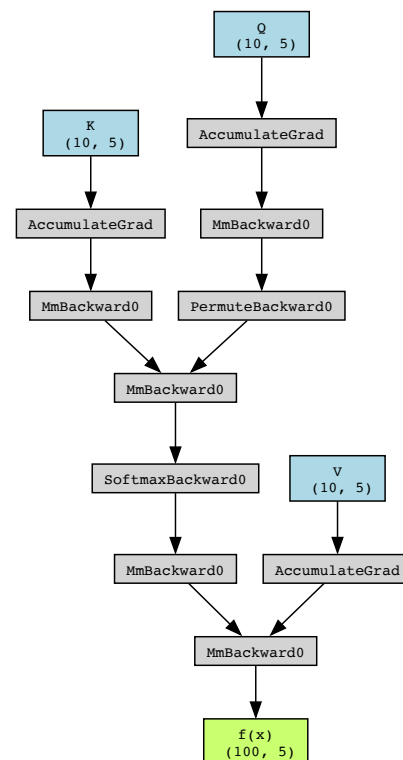

```
1: if age  $\geq$  40 then
2:   if genre = war or genre = western then
3:     return 4.3
4:   else
5:     return 1.5
6:   end if
7: else
8:   if release year > 1998 then
9:     return 3.5
10:  else
11:    return 2.0
12:  end if
13: end if
```

10 / 15

$$\Pr(\text{spam} \mid \text{email features} = x) = \frac{1}{1 + \exp(-(w_1x_1 + w_2x_2 + b))}$$

11 / 15

```
def f(x):
    k = x @ K
    q = x @ Q
    a = torch.softmax(k @ q.T, dim=1)
    return a @ x @ V
```

12 / 15

## This course

- ▶ Statistical framework for supervised machine learning
  - ▶ Basic prediction theory
  - ▶ Evaluation criteria (e.g., risk, calibration, bias)
- ▶ Algorithmic paradigms for supervised machine learning
  - ▶ Memorization and space partitioning
  - ▶ Deriving algorithms based on statistical models
  - ▶ Numerical optimization
- ▶ Some modeling techniques
  - ▶ Statistical models
  - ▶ Feature maps, kernels, neural networks
  - ▶ Regularization

13 / 15

More machine learning

- ▶ **Supervised learning:** data available is input/output pairs
- ▶ **Unsupervised learning:** do something with just the inputs
- ▶ **Online learning:** continuously make predictions over time
- ▶ **Reinforcement learning:** make decisions in reactive environment

14 / 15

Beyond machine learning

- ▶ **Statistical inference:** quantify uncertainty, determine causality, etc.
- ▶ **Artificial intelligence:** efficient knowledge representation and reasoning
- ▶ **Learning theory:** mathematical models and stat/comp. limits of learning
- ▶ ...
