©1998-1999, Henning Schulzrinne

Overview

- new Internet services: “telephone”, “radio”, “television”
- why Internet telephony?
- why not already?
- Internet telephony modalities
- components needed:
 - data transport
 - resource reservation
 - signaling
 - service location

New Internet services

- tougher: replacing dedicated electronic media
- typewriter model of development
- yet another convergence?

The phone works — why bother with VoIP?

user perspective

carrier perspective

- variable compression: tin can to broadcast quality
 - security through encryption
 - caller, talker identification
 - better user interface
 - internat. calls: TAT transatlantic cable = \$0.03/hr
 - no local access fees (3.4c)
 - easy: video, whiteboard, ...
- silence suppression \Rightarrow traffic \downarrow
 - shared facilities \Rightarrow management, redundancy
 - advanced services (simpler than AIN and CTI)
 - operational advantages
 - cheaper switching
 - fax as data

The new phone companies

- separation bit carriage \leftrightarrow services
- anybody with Internet connection can provide services (ACD, 800, 900, directory, ...)
- distinction “in” vs. “out” of network not useful
- incremental start-up investment not large
- new players:
 - cable companies \Rightarrow no new infrastructure, but mostly one-way
 - electric utilities \Rightarrow need line management anyway
 - Qwest, IXC (resell to ISPs), ...

Internet telephony as PBX replacement

global Internet not quite ready \Rightarrow try as PBX

- have mission-critical LAN, PCs anyway
- usually ample (if switched) bandwidth, low latency
- packet switching is cheaper
- network PCs $\stackrel{\$}{=}$ ISDN phones
- no need for billing

Internet telephony services

- voice mail → email
- calendar integration
- user-programmable call processing logic
- call first available sales person (ACD)
- call whole department
- web IVR
- return web page with favorite “on hold” music

Internet telephony services

- camp-on without holding a line
- short message service (“instant messaging”)
- schedule call into the future
- call with expiration date
- add/remove parties to/from call  mesh
- “buddy lists”

Switching costs

| switching method | ports | Gb/s | cents/kb/s | \$/interface |
|---------------------|---------|------|------------|--------------|
| 10BaseT hub | 16 | 0.16 | 0.1 | 9.4 |
| 100BaseT hub | 16 | 1.6 | 0.05 | 46 |
| 10BaseT switch | 24 | 0.24 | 1.2 | 121 |
| 100BaseTX switch | 8 | 0.80 | 0.15 | 156 |
| router | | 2.1 | 16.0 | |
| local ATM switch | 16 | 2.48 | 1.0 | 1581 |
| PBX | 256 | 0.02 | 218. | 140 |
| 5ESS local (no AIN) | 5,000 | 0.32 | 469. | 300 |
| 5ESS local (AIN) | 20,000 | 1.28 | 273. | 175 |
| 4ESS toll | 100,000 | 6.40 | 7.8 | |

Telephone costs

| | |
|----------------------------|--------|
| infrastructure | 10-23% |
| switching and transmission | 6% |
| overhead | 49% |
| access | 34% |
| operations support systems | 11% |

Transport costs

| network | \$/min | \$/MB |
|---|-----------|-------------|
| wholesale telephone | 0.01–0.02 | |
| U.S. domestic interstate consumer rates | 0.05–0.15 | |
| U.S. domestic intrastate consumer rates | 0.05–0.25 | |
| modem | | 0.25 – 0.50 |
| private line | | 0.50 – 1.00 |
| frame relay | | 0.30 |
| MCI frame SVC | | 0.05 |
| Internet | | 0.04 – 0.15 |
| Internet modem | | 0.33 |
| Internet backbone | | 0.01 |

1 minute voice = 480 kB with silence suppression, 1 MB
without

Phone usage

“Free” phone calls does not mean unbounded increase:

| year | lines (millions) | local calls min/day/line | local calls min/day/person |
|------|---------------------|-----------------------------|-------------------------------|
| 1980 | 102.2 | 39 | 17.5 |
| 1988 | 127.1 | 39 | 20.2 |
| 1996 | 166.3 | 40 | 25.1 |

Why aren't we using it now?

Internet capacity \ll phone traffic:

| | | | | | |
|-----------------------------|-----|------|--------------------|-----|------|
| world phone traffic | 600 | Gb/s | U.S. total | 368 | Gb/s |
| international traffic | 13 | Gb/s | U.S. interstate | 55 | Gb/s |
| | | | AT&T long distance | 61 | Gb/s |
| MCI Internet | 1.8 | Gb/s | | | |
| public Internet (late 1997) | 75 | Gb/s | | | |

- unpredictable sound quality, reliability
- doesn't work well for dial-up users
- no cheap Internet devices
- 640 M phone lines, 122 M in U.S. \Rightarrow gateways
- no billing infrastructure

Projections

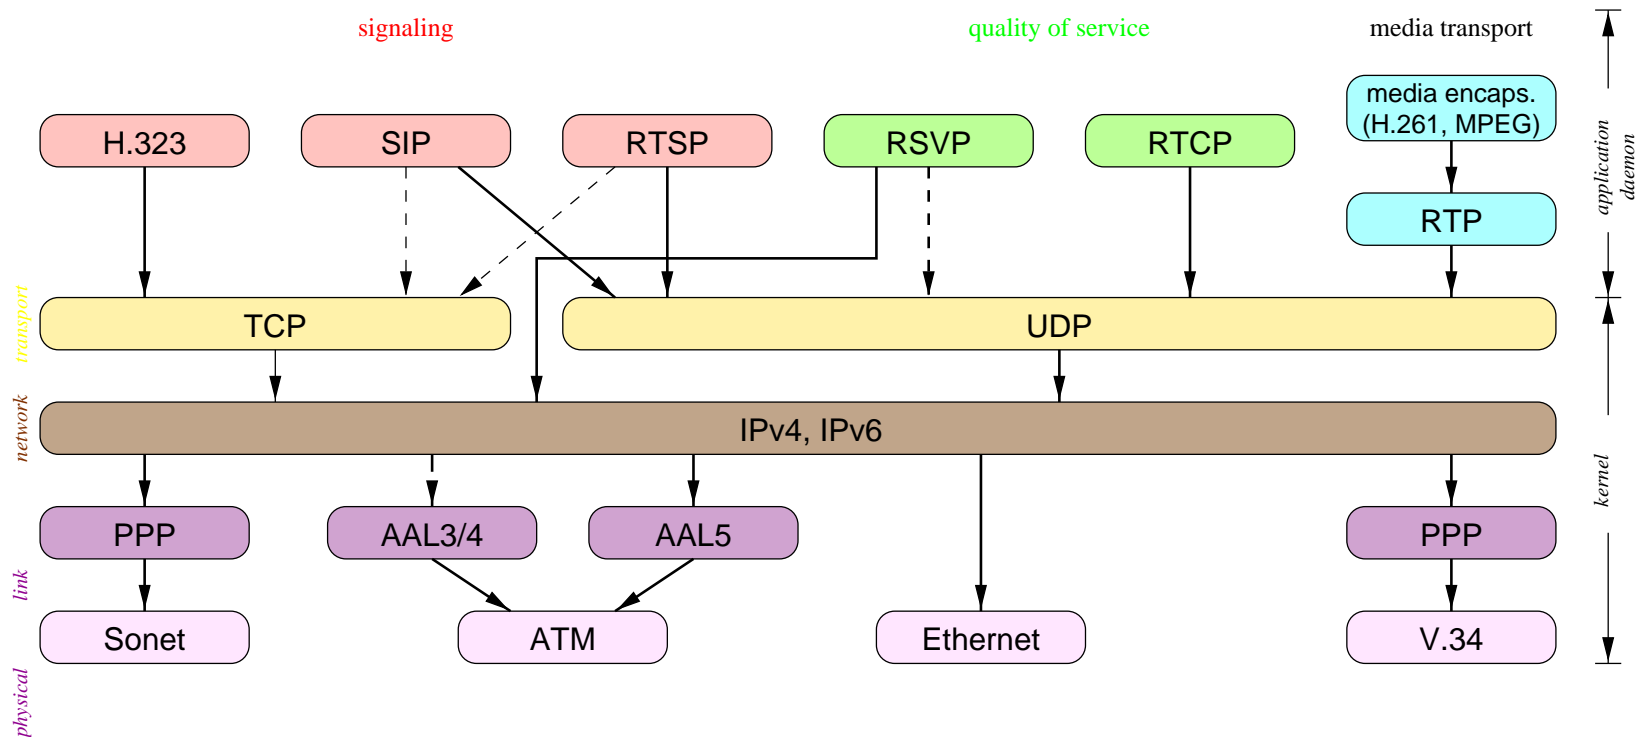

- MCI: “80% data, 20% voice”
- “AT&T could lose \$350 million in international calls by 2001”
- “By 2002, the Internet could account for 11% of U.S. and international long-distance voice traffic”
- “Up to 10% of the world’s fax market, which generates \$45 billion in telecom revenue a year, will move to Internet in 2 or 3 years”
- May 1999: BT builds IP phone network in Spain
- but: cable modems only 250,000 to 275,000 users in US, 10% of Internet users by 2000

Data vs. Voice Traffic

Components for Internet Multimedia

Internet multimedia protocol stack

Components for Internet Multimedia

multicast: routing, address allocation

data transport: RTP

resource reservation: RSVP, YESSIR, diff-serv

“TV” – announcing multicast sessions: SAP

“phone” – session setup for conferences/telephony: SIP

“VCR” – control of streaming media: RTSP

local applications: conference bus

policy issues: billing, firewall access, clearing houses

Applications for Multicast

- audio-video distribution (1-to-many) and symmetric (all-to-all)
- distributed simulation (war gaming, multi-player Doom, ...)
- resource discovery (where's the next time server?)
- file distribution (stock market quotes, new software, ...)
- network news (Usenet)

Host group model

Deering, 1991:

- senders need not be members;
- groups may have any number of members;
- there are no topological restrictions on group membership;
- membership is dynamic and autonomous;
- host groups may be transient or permanent.

IP Multicast: Problems

- multicast routing \Rightarrow state $\propto S, G$
- proposals:
 - DVMRP, PIM-DM for dense groups
 - PIM-SM or CBT for sparse groups (“core”)
- overlay networks (Mbone) hard to maintain
- billing and charging (satellite TV problem)
- multimedia applications mostly on-demand

Multicast address allocation

- about 268 mio. “class D” addresses
- can't have FCC assign channels
- hierarchical borrowing, using DHCP locally
- IETF malloc WG

Data transport – RTP

Real-Time Transport Protocol (RTP) = data + control

data: timing, loss detection, content labeling, talkspurts, encryption

control: (RTCP) \Rightarrow periodic with $T \sim$ population

- QOS feedback
- membership estimation
- loop detection

RTP functions

- segmentation/reassembly done by UDP (or similar)
- resequencing (if needed)
- loss detection for quality estimation, recovery
- intra-media synchronization: remove delay jitter through playout buffer
- intra-media synchronization: drifting sampling clocks
- inter-media synchronization (lip sync between audio and video)
- quality-of-service feedback and rate adaptation
- source identification

Resource Reservation

- *can't* compensate for lack of bandwidth or reliability
- *can* provide incumbency protection
- receiver makes requests \Rightarrow RSVP
- sender makes requests \Rightarrow YESSIR
- issues: scaling (state), security, complexity

Internet telephony modes

- tail-end hop off \Rightarrow callee has phone
- front-end hop on \Rightarrow caller uses phone
- Internet in the middle: per-call, multiplexed

Internet “signaling”

all non-data (“out-of-band”) functions:

routing: unicast; DVMRP, PIM, CBT for multicast ✓

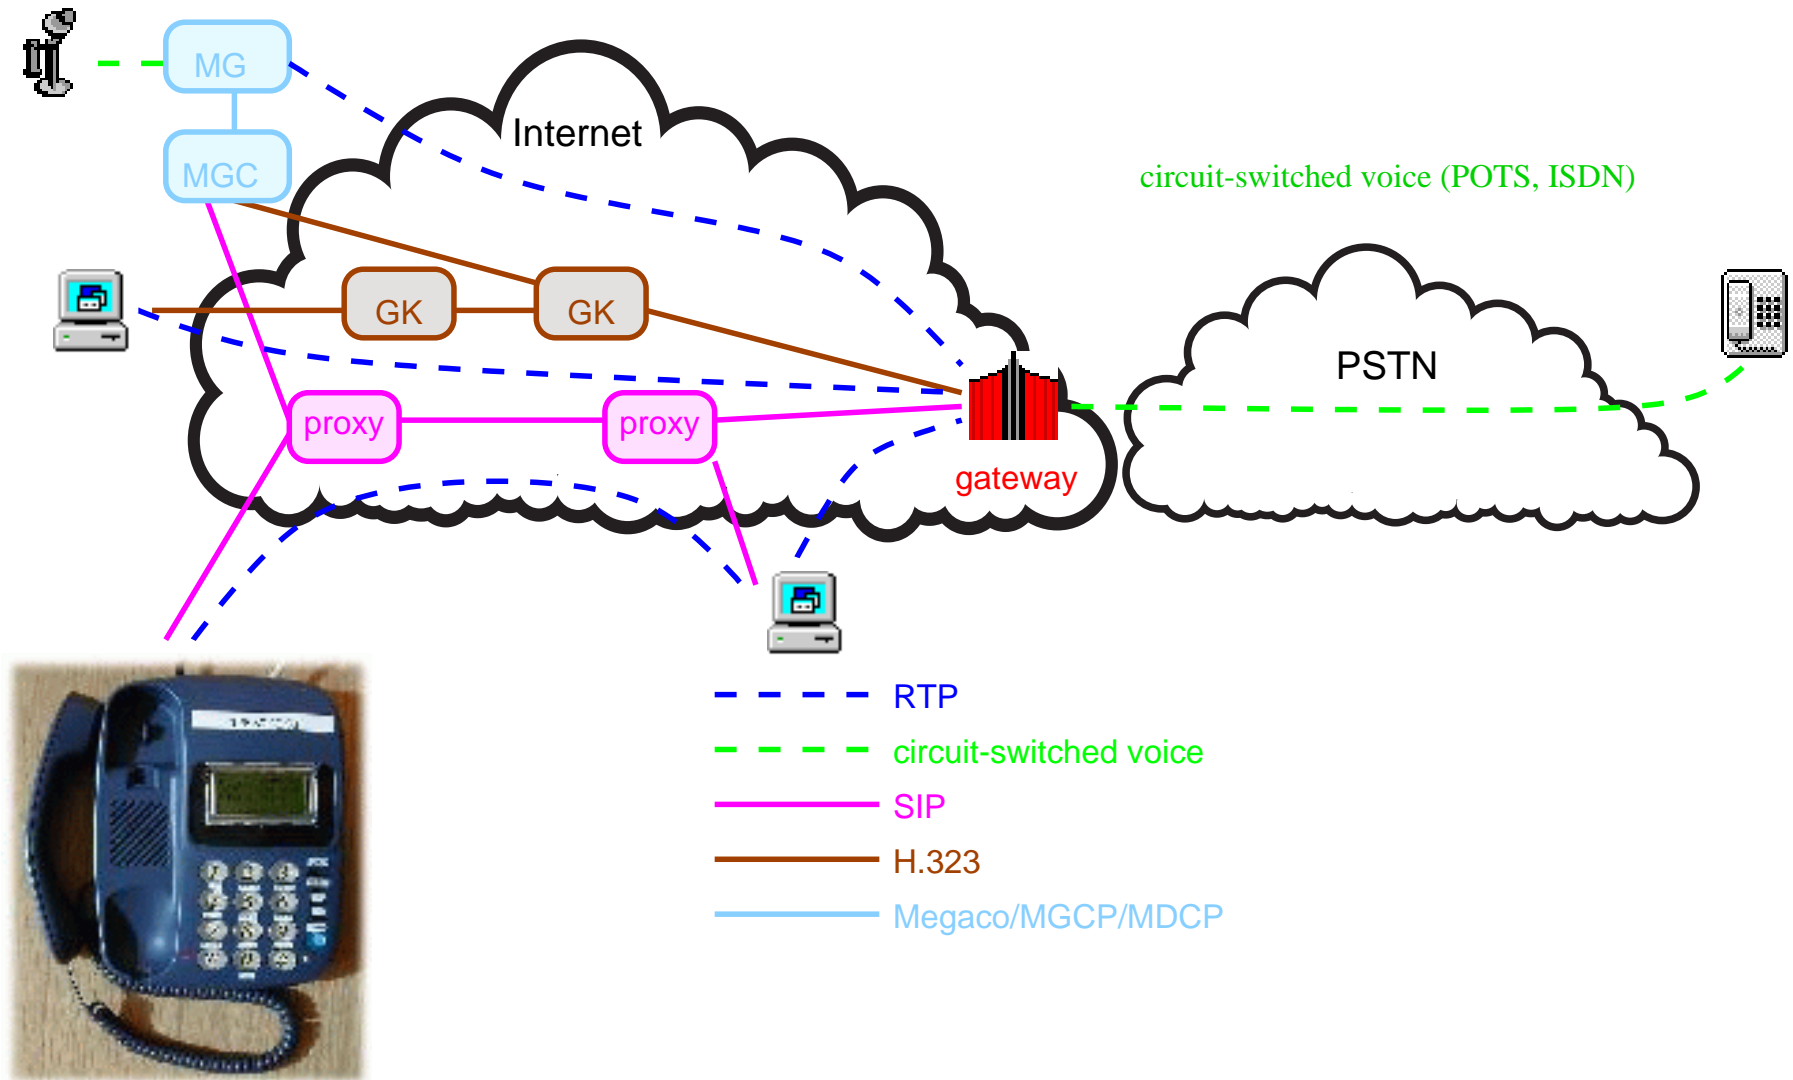

quality of service: RSVP, RTCP, diff-serv ✓

user Contact: map name to location (IP address)

call set-up/teardown: SIP, H.323

policy, billing: “vertical” protocols

Architecture

Differences: Internet Telephony ↔ POTS

- separate control, transport (UDP) ⇒ no triangle routing
- separate connectivity from resource availability
- separate services from bit transport
- datagram service ⇒ less bootstrapping
- in-band signaling ⇒ higher speed
- features “network” → end system: distinctive ringing, caller id, speed dialing, number translation, ... ⇒ scaling
- features: intra-PBX = inter-LATA and general
- protocols: user-network = network-network signaling

Internet Telephony

- multimedia basically free (unlike ISDN)
- minimal extensions: signaling, not “stove pipe”
- leverage existing work: email, HTTP security, URIs, HTML, cgi, ...

Light-weight signaling: Session Initiation Protocol (SIP)

IETF MMUSIC working group (RFC 2543)

- light-weight generic signaling protocol
- typical post-dial delay: 1.5 round-trip time (with UDP)
- network-protocol independent: UDP or TCP (or AAL5 or X.25)

SIP functionality

- call user
- re-negotiate call parameters
- manual and automatic forwarding
- call center: reach first (load distribution) or reach all (department conference)
- *personal mobility* (complements data link/IP mobility) 
change of terminal (PC, digital cordless, palmtop),
location
- terminate and transfer calls

Service creation: Call Processing Language

- incoming and outgoing
- “if somebody is trying to call for the 3rd time, allow mobile”
- “try office and lab in parallel, if that fails, try home”
- “allow call to mobile if I’ve talked to person before”
- users and administrators
- not quite like cgi: multiple responses? timers?
- Tcl, Java?

Real-Time Streaming Protocol (RTSP)

remote-control streaming media \Rightarrow

- “rough” synchronization (fine-grained \Rightarrow RTP sender reports)
- virtual presentations = synchronized playback from several servers \Rightarrow command timing
- load balancing using redirection at connect, during stream
- supports any session description
- device control \Rightarrow camera pan, zoom, tilt
- caching: similar to HTTP, except “cut-through”

Open Operational Issues

- billing
- finding the nearest gateway to the Internet (☞ GLP)
- mapping E.164 (phone) numbers to IP addresses
- controlling phones through the Internet (PINT)
- 911 services
- CALEA
- anonymity and certified identity

Billing

- simplification: email/web delivery, credit card payment

- what to bill for?

transport services: volume, time, reserved resources;
“free upgrades”

signaling services: filtering, forwarding, scripting,
mobility, ...

storage services: voice mail

gateway services: PSTN gateways

Emergency (911) services

- U.S.: dial “911” anywhere → nearest Public Safety Answering Points
- look up street address from telephone company database
- but...
 - IP address dynamically assigned
 - may not be correlated to geography
 - dial-in from hotel, remote sites?
 - prevent services: hanging up, transfer, hold, ...

Emergency services

- advantages:
 - multimedia (video, medical data, ...)
 - medical database access, with authentication token
 - remote activation of medical devices
- solutions:
 - enclose (signed) location information with call
 - IP address → provider → lookup (RADIUS)  needs authenticated protocol
 - GPS

Conclusion

- transition of separate circuit-switched \Rightarrow IP-based applications
- packets from the inside out or the outside in?
- IP over ATM, Sonet, WDM?
- IPv6 or NATs?
- “the end of distance” or tiered IP service?
