---

---

---

---

**Questions about the previous lab**

---

---

---

---

---

---

---

---

---

**Questions about HW1 (or HW0)**

---

---

---

---

---

---

---

---

---

## HW1 submit instructions

---

---

---

---

---

---

---

---

## Recap from Lab 1

- Intro to Unix, Hardware, Server-Client relationships, concept behind telnet
- Intro to C
- Basic structure of a program
- Compiling and running programs
- Variables, and assigning values to them
- Data types and I/O
- \

---

---

---

---

---

---

---

---

## Recap from Lab 2

- Details on printf
- Details on scanf
- Conversion between data types
- Math operators
- Command Line Parameters

---

---

---

---

---

---

---

---

## Math ops continued

- +, -, \*, /, %
- ++, --
- +=, -=, \*=, /=

---

---

---

---

---

---

---

---

## Other symbols

- <, >, <<, >>
- !, !=
- &, &&, |, ||
- #
- (), {}, []

---

---

---

---

---

---

---

---

## Arrays

- What are arrays?
  - Arrays are sets of consecutive memory locations used to store data
- Typical array declaration
  - `int data_list[3];`
  - `data_list[0], data_list[1], data_list[2]`
  - Dimensionality
  - What is the index?
  - You can also initialize by doing the following
    - `int data_list[3] = {1.0, 2.0, 3.0};`

---

---

---

---

---

---

---

---

## Code sample

```
#include <stdio.h>
#define N 5

int main (void) {
    float a[N], total, average;

    a[0] = 34.0;
    a[1] = 27.0;
    a[2] = 45.0;
    a[3] = 82.0;
    a[4] = 22.0;

    total = a[0] + a[1] + a[2] + a[3] + a[4];
    average = total/5.0;
    printf("Total is %f and Average is %f\n", total, average);
    return(0);
}

//run array.c
```

---

---

---

---

---

---

---

---

## Multidimensional arrays

- `int matrix [2][3];`
- Now you assign and reference by saying
  - `matrix [0][0];`
  - `matrix [0][1];`
  - `matrix [0][2];`
  - `matrix [1][0];`
  - `matrix [1][1];`
  - `matrix [1][2];`

---

---

---

---

---

---

---

---

## Strings

- Sequence of chars (an array of characters)

```
#include <stdio.h>

int main (void) {
    char name[6];

    name = "Suhit";

    printf("My name is %s\n", name);
    return(0);
}
```

---

---

---

---

---

---

---

---

## Strings

- Sequence of chars (an array of characters)
- ```
#include <stdio.h>
```

```
int main (void) {  
    char name[6];  
  
    name = "Suhit";           // This is wrong  
  
    printf("My name is %s\n", name);  
    return(0);  
}
```

---

---

---

---

---

---

---

---

## Strings II

```
#include <stdio.h>  
  
int main (void) {  
    char name[6];  
  
    name[0] = 'S';  
    name[1] = 'u';  
    name[2] = 'h';  
    name[3] = 'i';  
    name[4] = 't';  
    name[5] = '\0';           //adding a null character at the end of the string  
  
    printf("My name is %s\n", name);  
    return(0);  
}
```

---

---

---

---

---

---

---

---

## Strings III

- #include <string.h>
  - to include special string manipulation thingsies
    - strcpy
    - strcmp
    - strlen
    - strcat
    - strtok

---

---

---

---

---

---

---

---

## Strings IV

```
#include <stdio.h>
#include <string.h>

int main (void) {
    char name[6];
    //one character at the end is stored for null
    strcpy(name, "Suhit");

    printf("My name is %s\n", name);
    return(0);
}
```

---

---

---

---

---

---

---

---

## Strings V

```
#include <stdio.h>
#include <string.h>

int main (void) {
    char name[60];
    /* last character is still reserved for null, store at most 59
    characters */
    strcpy(name, "Suhit");

    printf("My name is %s\n", name);
    return(0);
}
```

---

---

---

---

---

---

---

---

## Strings VI

```
#include <stdio.h>
#include <string.h>

char first_name [100];
char last_name [100];
char full_name [200];

int main (void) {
    strcpy(first_name, "Suhit");
    strcpy(last_name, "Gupta");

    strcpy(fullname, first_name);
    strcat(fullname, " ");
    strcat(fullname, last_name);

    printf("My full name is %s\n", full_name);
    return(0);
}

//run strings.c
```

---

---

---

---

---

---

---

---

## Strings VII – Reading Strings

- `fgets(name, sizeof(name), stdin);`
  - `name` is the name of the character array
  - `sizeof` tells the program how much to read
  - `stdin` – keyboard

```
#include <stdio.h>
#include <string.h>

char line [100];

int main () {
    printf("Enter a line: ");
    fgets(line, sizeof(line), stdin);

    printf("The length of the line is %d\n", strlen(line));
    return(0);
}

//Run strings2.c
```

---

---

---

---

---

---

---

---

## Strings VIII

- `fgets` has last character as end-of-line (newline)
- Some people will munge the last newline char by doing the following
  - `line[strlen(line)-1] = '\0'`
- Then use `sscanf` – like `scanf`, but used to scan strings
  - Usage : `sscanf(name, format, &var1, &var2, ...);`
  - Why not use `atoi`?
    - Because you scan in different types of values and format them into different types of vals.
    - `sscanf(in_string, "%d%d%d%s", &a, &b, &c, tmp);`

---

---

---

---

---

---

---

---

## BTW...

- In Ch. 5, read about different data types, like different types of `int`, types of `float`.
- Also read about hexadecimal and octal
- We will cover this in depth as the course goes on

---

---

---

---

---

---

---

---

## Loops and conditionals

- if
  - need to know <, >, ==, !=
  - usage: `if (expr) {stmt...}`  
`else if (expr) {stmt...}`  
`else {stmt}`
- while
  - usage: `while (cond) {stmt...}`
  - break;

---

---

---

---

---

---

---

---

## Next time...

- Iteration/loops
  - While
  - For
  - Do while
- Conditional statements
  - If
  - Switch
- Methods and method calls
  - Variable scope
  - Return values

---

---

---

---

---

---

---

---

## Assignment

- Read Ch. 6 from the Practical C Programming book
- HW1

---

---

---

---

---

---

---

---
