

Semantics: Representations and Analyses

Slides adapted from Julia Hirschberg, Dan Jurafsky, Chris Manning

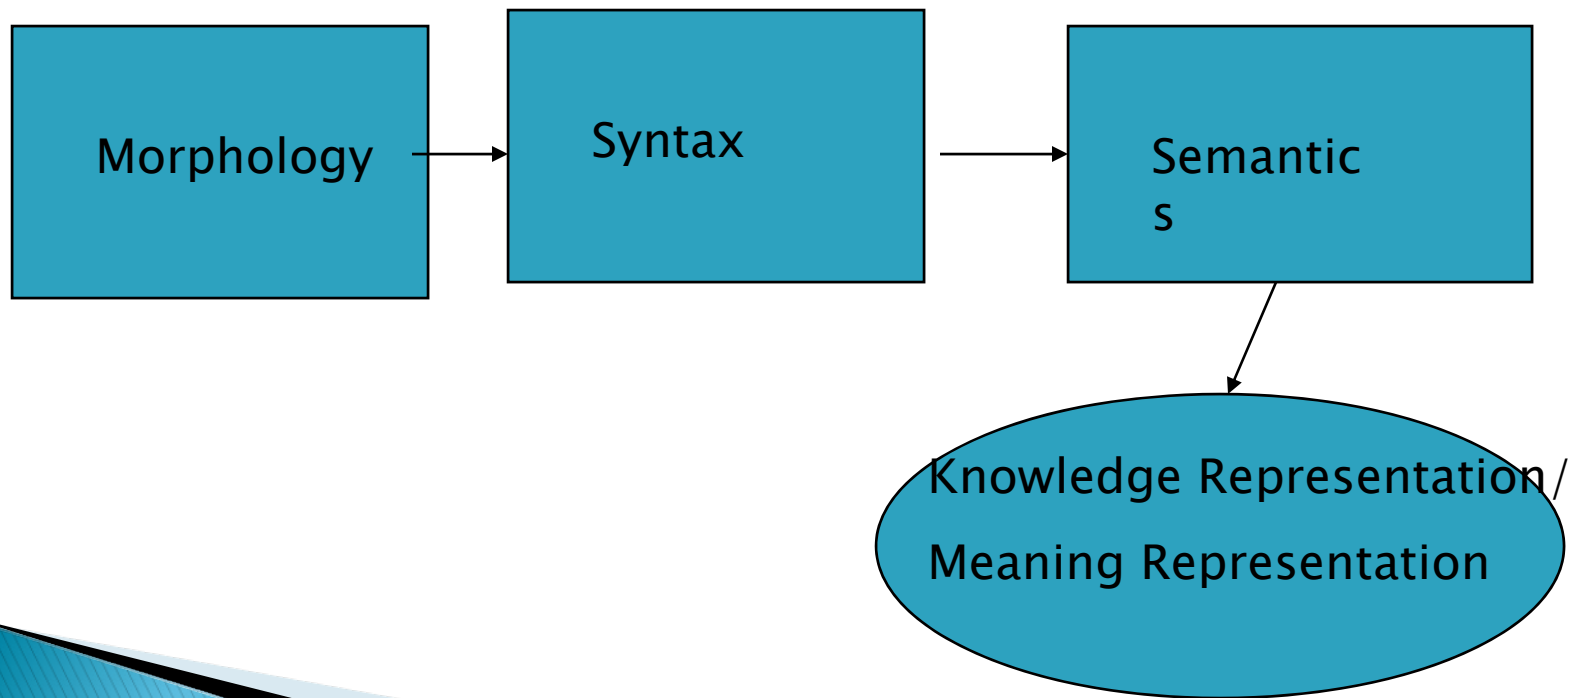

Question-Answering / Dialog

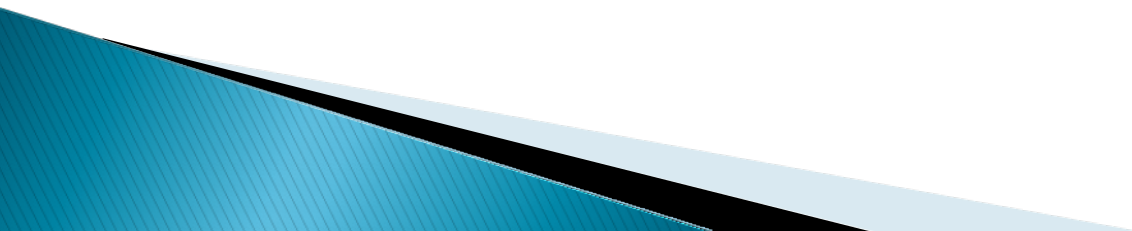

Where does the information come from?

- ▶ One possibility:
 - <http://newyork.citysearch.com>

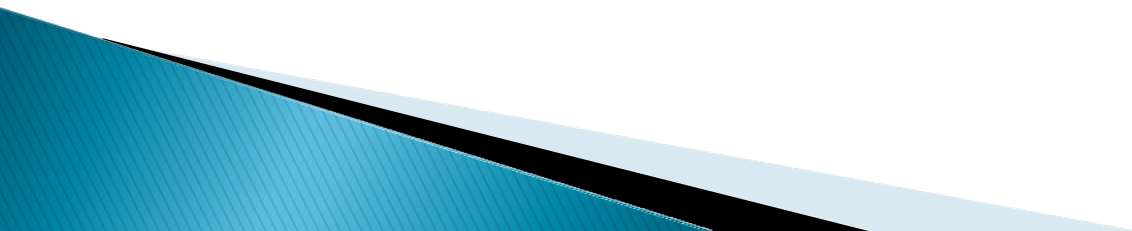

NL Architecture

Semantic Considerations

- ▶ Meaning Representation
 - ▶ Translation from syntax into the meaning representation
 - ▶ Word meaning disambiguation
 - ▶ Relations between words
- 

Meaning Representation

- ▶ To represent questions
 - ▶ To represent knowledge drawn from text
- 

What Can Serve as a Meaning Representation?

- ▶ Anything that allows us to
 - Answer questions (What is the best French restaurant in the East Village?)
 - Determine truth (Is The Terrace in the Sky on 118th?)
 - Draw inferences (If The Terrace is in Butler Hall and Butler Hall is the tallest building on the West Side, then The Terrace is in the tallest building on the West Side.)

What kinds of meaning do we want to capture?

- ▶ Categories/entities
 - Tau, Jane, Asian cuisine, vegetarian
- ▶ Events
 - taking a taxi, nomination of Obama as Democratic candidate
- ▶ Time
 - Oct 30, next week, in 2 months
- ▶ Aspect
 - Kathy knows how to run. Kathy is running. Kathy ran to the restaurant in 5 min.
- ▶ Beliefs, Desires and Intentions (BDI)

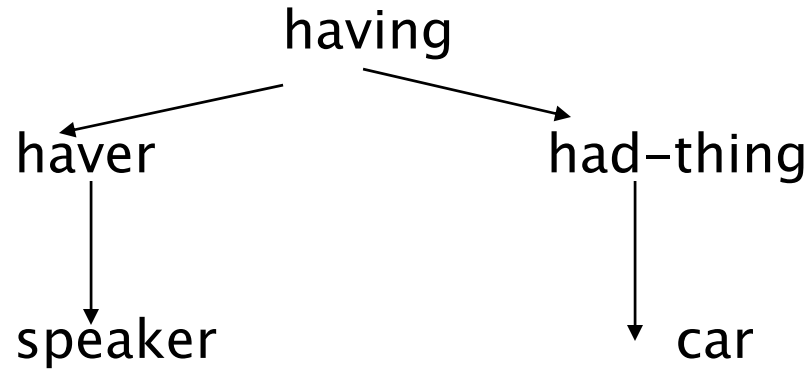

Meaning Representations

- ▶ All represent ‘linguistic meaning’ of
I have a car
and state of affairs in some world
- ▶ All consist of structures, composed of symbols representing objects and relations among them

- **FOPC:**

$\exists x, y \{ \textit{Having}(x) \wedge \textit{Haver}(S, x) \wedge \textit{HadThing}(y, x) \wedge \textit{Car}(y) \}$

▶ **Semantic Net:**

▶ **Conceptual Dependency Diagram:
Physical-object**

▶ **Frame**

Having

Haver: S

HadThing: Car

A Standard Representation: Predicate–Argument Structure

- ▶ Represents concepts and relationships among them
 - Nouns as concepts or arguments (red(ball))
 - Adjectives, adverbs, verbs as predicates (red(ball))
- ▶ Subcategorization (or, argument) frames specify number, position, and syntactic category of arguments
 - NP likes NP
 - NP likes Inf–VP
 - NP likes NP Inf–VP

Semantic (Thematic) Roles

- ▶ Subcat frames link arguments in surface structure with their semantic roles
 - Agent: **George** hit Bill. Bill was hit by **George**.
 - Patient: George hit **Bill**. **Bill** was hit by George.
- The claim of a theory of semantic roles is that these arguments of predicates can be usefully classified into a small set of semantically contentful classes
 - And that these classes are useful for explaining lots of things

Common semantic roles

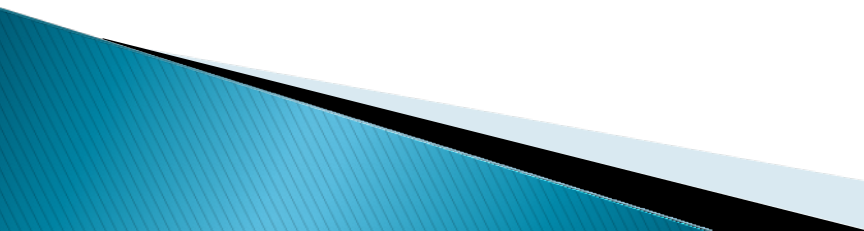

- ▶ **Agent**: initiator or doer in the event
- ▶ **Patient**: affected entity in the event; undergoes the action
 - Sue killed the rat.
- ▶ **Theme**: object in the event undergoing a change of state or location, or of which location is predicated
 - The ice melted
- ▶ **Experiencer**: feels or perceives the event
 - Bill likes pizza.
- ▶ **Stimulus**: the thing that is felt or perceived

Common semantic roles

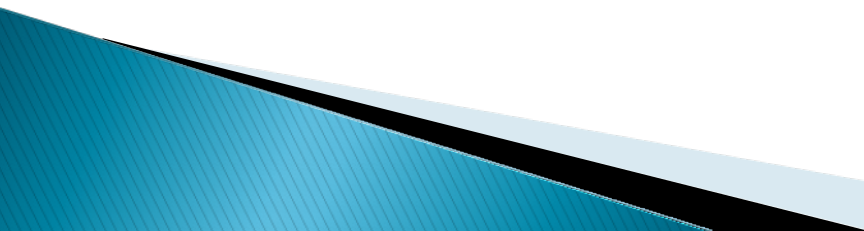

- ▶ **Goal:**
 - Bill ran to Copley Square.
- ▶ **Recipient** (may or may not be distinguished from Goal):
 - Bill gave the book to Mary.
- ▶ **Benefactive** (may be grouped with Recipient):
 - Bill cooked dinner for Mary.
- ▶ **Source:**
 - Bill took a pencil from the pile.
- ▶ **Instrument:**
 - Bill ate the burrito with a plastic spork.
- ▶ **Location:**
 - Bill sits under the tree on Wednesdays

Common semantic roles

Try for yourself!

1. The submarine sank a troop ship.
 2. Doris hid the money in the flowerpot.
 3. Emma noticed the stain.
 4. We crossed the street.
 5. The boys climbed the wall.
 6. The chef cooked a great meal.
 7. The computer pinpointed the error.
 8. A mad bull damaged the fence on Jack's farm.
 9. The company wrote me a letter.
 10. Jack opened the lock with a paper clip.
- 

Linking of thematic roles to syntactic positions

- ▶ **John** opened **the door**
 - ▶ AGENT THEME
 - ▶ **The door** was opened by **John**
 - ▶ THEME AGENT
 - ▶ **The door** opened
 - ▶ THEME
 - ▶ **John** opened **the door** with **the key**
 - ▶ AGENT THEME INSTRUMENT
- 

Deeper Semantics

- ▶ From the WSJ...
 - He melted her reserve with a husky-voiced paean to her eyes.
 - If we label the constituents **He** and **her reserve** as the **Melter** and **Melted**, then those labels lose any meaning they might have had.
 - If we make them **Agent** and **Theme** then we can do more inference.

Selectional Restrictions

- ▶ **Selectional Restrictions:** constraints on the *types* of arguments verbs take
George assassinated the senator.
**The spider assassinated the fly.*
assassinate: intentional (political?) killing
- ▶ *The astronaut married the star.*

Problems

- ▶ What exactly is a role?
- ▶ What's the right set of roles?
- ▶ Are such roles universals?
- ▶ Are these roles atomic?
 - I.e. Agents
 - Animate, Volitional, Direct causers, etc
- ▶ Can we automatically label syntactic constituents with thematic roles?

First Order Predicate Calculus

- ▶ Not ideal as a meaning representation and doesn't do everything we want -- but better than many...
 - Supports the determination of truth
 - Supports compositionality of meaning
 - Supports question–answering (via variables)
 - Supports inference

NL Mapping to FOPC

- ▶ **Terms**: constants, functions, variables
 - **Constants**: objects in the world, e.g. **Nobu**
 - **Functions**: concepts, e.g. pricerangeof(**Nobu**)
 - **Variables**: x, e.g. pricerangeof(**x**)
- ▶ **Predicates**: symbols that refer to relations that hold among objects in some domain or properties that hold of some object in a domain
 - likes(Kathy, sushi)
 - female(Kathy) person(Kathy)

- ▶ Logical connectives permit compositionality of meaning

sushi(x) \rightarrow likes(Kathy,x) “Kathy likes sushi”

Japanese(Nobu) \wedge restaurant(Nobu) “Nobu is a Japanese restaurant”

Wants-cuisine(Kathy,Japanese) \vee wants-cuisine(Kathy,French) “Kathy wants either Japanese or French cuisine”

Suppose we want to represent these sentences using thematic roles?

- ▶ Sentences in FOPC can be assigned truth values
 - Atomic formulae are T or F based on their presence or absence in a DB (Closed World Assumption?)
 - Composed meanings are inferred from DB and meaning of logical connectives

- location(The Spotted Pig, The Village)
- sameblock(Marisca, The Spotted Pig)
- location(The Spotted Pig, The Village) \wedge sameblock(Marisca, The Spotted Pig) \rightarrow location(Marisca, The Village)

▶ Limitations:

- Do ‘and’ and ‘or’ in natural language really mean ‘ \wedge ’ and ‘ \vee ’?

Mary got married and had a baby. And then...

Your money or your life!

- Does ‘ \rightarrow ’ mean ‘if’?

If you go, I’ll meet you there.

- How do we represent other connectives?

She was happy but ignorant.

▶ Quantifiers: \exists, \forall

- Existential quantification: There is a unicorn in my garden. Some unicorn is in my garden.
- Universal quantification: The unicorn is a mythical beast. Unicorns are mythical beasts.
- Many? A few? Several? A couple?

Some sentences

- ▶ Where is The Spotted Pig?
 - ▶ What is the phone number of The Spotted Pig
 - ▶ Which midtown French restaurants have four–star reviews?
 - ▶ Restaurants in the Village are cheaper than restaurants on the Upper East Side.
 - ▶ There is a French restaurant on 66th between Madison and Park.
- 

Some Logical Forms

- ▶ $\exists x \forall y \text{ loves } (y,x)$
- ▶ $\forall x \exists y \text{ loves } (y,x)$

Temporal Representations

- ▶ How do we represent time and temporal relationships between events?

It seems only yesterday that Martha Stewart was in prison but now she has a popular TV show. There is no justice.

- ▶ Where do we get temporal information?
 - Verb tense
 - Temporal expressions
 - Sequence of presentation
- ▶ Linear representations: Reichenbach '47

- **Utterance time (U)**: when the utterance occurs
- **Reference time (R)**: the temporal point-of-view of the utterance
- **Event time (E)**: when events described in the utterance occur

George is eating a sandwich.

-- E,R,U →

George had eaten a sandwich (when he realized...)

E - R - U →

George will eat a sandwich.

--U,R - E →

While George was eating a sandwich, his mother arrived.

Verbs and Event Types: Aspect

- ▶ **Statives**: states or properties of objects at a particular point in time
I am hungry.
- ▶ **Activities**: events with no clear endpoint
I am eating.
- ▶ **Accomplishments**: events with durations and endpoints that result in some change of state
I ate dinner.
- ▶ **Achievements**: events that change state but have no particular duration – they occur in an instant
I got the bill.

Beliefs, Desires and Intentions

- ▶ Very hard to represent internal speaker states like believing, knowing, wanting, assuming, imagining
 - Not well modeled by a simple DB lookup approach so..
 - Truth in the world vs. truth in some possible world

George imagined that he could dance.

George believed that he could dance.
- ▶ Augment FOPC with special modal operators that take logical formulae as arguments, e.g. believe, know

Believes(George, dance(George))

Knows(Bill, Believes(George, dance(George)))

▶ **Mutual belief:** I believe you believe I believe....

- Practical importance: modeling belief in dialogue
- Clark's **grounding**

Summary

- ▶ Logical form as one meaning representation
- ▶ Many hard problems in full semantic representation:
 - Temporal relations: tense, aspect
 - BDI
- ▶ Current representations impoverished in many respects
- ▶ Read Ch 17.2–17.4, 18.1–18.7 (cover material through today)
