Lecture-5

- Operator overloading
- Standard template library
 - string
 - vector
 - list
 - iterators

Operator overloading

- On two objects of the same class, can we perform typical operations like
 - Assignment (=), increment (++), decrement(--)
 - Write to a stream (<<)
 - Reading to a stream (>>)
- Can be defined for user defined classes. ⇒
 Operator overloading
- Most of the common operators can be overloaded.
- Operators can be member/non-member functions

Operator overloading ... cont.

- Arity of operator
 - Number of parameters required.
- Unary operators take one argument
 - *E.g.*, ++, --, !, ~, etc.
 - C unary operators remain unary in C++
- Binary operators take two arguments.
 - *E.g.*, =, >, <, +, -, etc.
 - C binary operators remain binary.
- Typical overloaded operators
 - +, -, >, <, +=, ==, !=, <=, >=, <<, >>, []

Operator functions rules

- Member function operators
 - Leftmost operand must be an object (or reference to an object) of the class.
 - If left operand is of a different type, operator function must NOT be a member function
- Built-in operators with built-in data types
 CANNOT be changed.
- Non-member operator function must be a friend if
 - private or protected members of that class are accessed directly

Syntax

Member function

```
return_type classname :: operator symbol (args)
{
    // code
    }

Non-member function
```

```
return_type operator symbol (args)
{
    // code
  }
```

```
Example
class Integer
       private:
         int value;
       public:
         Integer (int val) : value (val) { }
         void operator ++() { value++; } // Member op
         friend Integer operator // Non-member op
              (const Integer& i, const Integer& j);
  };
  Integer operator + (const Integer&i, const Integer& j)
        return Integer (i.value + j.value);
  }
```

Standard template library

- Defines many useful classes.
- Popular among them
 - string, vector, list, map, iterators, etc.
 - Each of these is a class.
 - Has many useful functions.
- Reference:

http://www.processdoc.com/doc/cppstl/index.html

It lists all the functions, coding examples and many nice features for strings, vectors, lists and iterators.
