1 Introduction

My inspiration for designing a Fantasy Football Stat Tracker compiler transpired while participating in a fantasy football league with some friends. While the cost for participating in the fantasy football league is free of charge, most of the online fantasy football services charge a bundle for using their online stat tracker. The FFSTC will provide features for gathering player statistics, sorting based on category type, filtering by position type, stats comparison, and search by player name. Due to the development timeline, not all features will be available.

The features of the Fantasy Football Stat Tracker compiler will contain the following:

- Sorting algorithm for player stats
- Filtering for position by offense, defense, or specific position.
- Stats comparison by previous week or previous year
- Search function for players in the database
- Semantic checks for errors
  - Adding receiving stats to a defensive player will cause an error.
  - Adding field goal stats to a quarterback will be invalid.
  - Adding 1-point conversion stat to a quarterback will be invalid; however, a 2-point conversion will be valid.
2 Language Tutorial

FFSTC is a language used specifically for compiling statistical categories used in fantasy football leagues. When participating in a fantasy football draft, it is critical to obtain the key statistics for the top echelon players in the National Football League. This tutorial will show you how to write a simple program to obtain such critical statistics.

2.1 Commands

Prior to writing the language, here are some commands to get you started:

% java Main < [source file]

This will invoke the FFSTC compiler to begin compiling your source file.

2.2 FFSTC Database

The current version of FFSTC will use the statistics generated from the year 2006. Ensure that the following files are located in the Compiler directory:

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QBStats.csv</td>
<td>Contains statistical categories for the top 50 quarterbacks for the year 2006. The statistical categories include (Name, Position, Team, *Ranking, Passing Yards, Passing Touchdowns, Passing Interceptions, Rushing Yards, and Rushing Touchdowns).</td>
</tr>
<tr>
<td>RBStats.csv</td>
<td>Contains statistical categories for the top 50 running backs for the year 2006. The statistical categories include (Name, Position, Team, *Ranking, Rushing Yards, Rushing Touchdowns, Receiving Yards, and Receiving Touchdowns).</td>
</tr>
<tr>
<td>WRStats.csv</td>
<td>Contains statistical categories for the top 75 wide receivers for the year 2006. The statistical categories include (Name, Position, Team, *Ranking, # of Receptions, Receiving Yards, Receiving Touchdowns, Return Yards, Return Touchdowns).</td>
</tr>
<tr>
<td>TEStats.csv</td>
<td>Contains statistical categories for the top 50 tight ends for the year 2006. The statistical categories include (Name, Position, Team, *Ranking, # of Receptions, Receiving Yards, and Receiving Touchdowns).</td>
</tr>
<tr>
<td>KKRStats.csv</td>
<td>Contains statistical categories for the top 34 Kickers for the year 2006. The statistical categories include (Name, Position, Team, *Ranking, Field Goals Made for 0-19, 20-29, 30-39, 40-49, and 50+ yards, 1PT Made).</td>
</tr>
<tr>
<td>DEFStats.csv</td>
<td>Contains statistical categories for all 31 teams for the year 2006. The statistical categories include (Name, Position, Team, Rank, Points Allowed, Sacks, Safety, Interceptions, Fumble Recovery, Touchdowns).</td>
</tr>
</tbody>
</table>

* Rankings are based on Yahoo Rankings

Here are some fields extracted from the input file. All categories must begin with the token “%”:

%Name,%Position,%Team,%Rank,%PassYD,%PassTD,%PassINT,%RushYD,%RushTD
Peyton Manning,%QB,%IND,%4,%4397,%31,%9,%36,%4
Drew Brees,%QB,%NO,%9,%4418,%26,%11,%32,%0
Michael Vick,%QB,%ATL,%10,%2474,%20,%13,%1039,%2

%Name,%Position,%Team,%Rank,%RushYD,%RushTD,%RecYD,%RecTD
LaDainian Tomlinson,%RB,%SD,%1,%1815,%28,%508,%3
Larry Johnson,%RB,%KC,%2,%1789,%17,%410,%2
Steven Jackson,%RB,%STL,%3,%1528,%13,%806,%3
2.3 FFSTC Example

The following is an example of the syntax in the main program. The language should always begin with the keyword “ffstcmain” and end with the keyword “ffstcend.”

```
ffstcmain myprogram
...
...
ffstcend
```

Within the main program, you can write user-defined functions using the following syntax. The keyword “statsfunc” is used to identify a function, following by open and close parenthesis. “statsint” is a keyword to define an integer “q” as an argument in the function. The keywords “subbegin” and “subend” must be included to enclose the function body.

```
ffstcmain myprogram
statsfunc myfunction (statsint q)
    subbegin myfunctionstatements
    ...
    subend
ffstcend
```

In addition to defining functions, you can write statements and expressions within the main program. Prior to writing the statements and expressions, the keywords “subbegin” and “subend” must be enclosed.

```
ffstcmain myprogram
statsfunc myfunction (statsint q)
    subbegin myfunctionstatements
    ...
    subend
    subbegin mystatements
        z = {x + y * w};
        if {z > 10}
            x = {z};
        endif;
    subend
ffstcend
```
2.4 FFSTC Comments

Comments in FFSTC are omitted during the compilation process. You may designate comments by using the single-line notation “@@”

@@ This is a comment.

Or you may designate comments by using the multi-line notation “@%” and “%@”

@%
This is also a comment.
%@
3 Language Reference Manual

3.1 Lexical Conventions

3.1.1 Tokens

There are six types of tokens in this language: identifiers, keywords, constants, strings, expression operators, and separators. A whitespace must be used to separate tokens.

3.1.2 Comments

FFSTC supports single and multi-line comments. Single line comments are denoted using the notations @@. Multi line comments begin with @% and ends with %@.

Example:

@@ This is a valid comment

@%This is also a valid comment%@

3.1.3 Identifiers

An identifier is a sequence of letters and digits with the first character beginning with an alphabet. Identifiers are case sensitive.

3.1.4 Keywords

The following are identifiers reserved as keywords and may not be used otherwise.

<table>
<thead>
<tr>
<th>keyword</th>
<th>keyword</th>
<th>keyword</th>
<th>keyword</th>
<th>keyword</th>
</tr>
</thead>
<tbody>
<tr>
<td>while</td>
<td>endwhile</td>
<td>QB</td>
<td>TeamName</td>
<td></td>
</tr>
<tr>
<td>if</td>
<td>else</td>
<td>RB</td>
<td>bool</td>
<td></td>
</tr>
<tr>
<td>endif</td>
<td>bool</td>
<td>WR</td>
<td>int</td>
<td></td>
</tr>
<tr>
<td>FALSE</td>
<td>TRUE</td>
<td>TE</td>
<td></td>
<td></td>
</tr>
<tr>
<td>for</td>
<td>endif</td>
<td>KKR</td>
<td></td>
<td></td>
</tr>
<tr>
<td>continue</td>
<td>break</td>
<td>DEF</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The following are identifiers reserved for designating team names.

<table>
<thead>
<tr>
<th>team</th>
<th>team</th>
<th>team</th>
<th>team</th>
<th>team</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUF</td>
<td>BAL</td>
<td>HOU</td>
<td>DEN</td>
<td></td>
</tr>
<tr>
<td>MIA</td>
<td>CIN</td>
<td>IND</td>
<td>KAN</td>
<td></td>
</tr>
<tr>
<td>NE</td>
<td>CLE</td>
<td>JAC</td>
<td>OAK</td>
<td></td>
</tr>
<tr>
<td>NYJ</td>
<td>PIT</td>
<td>TEN</td>
<td>SD</td>
<td></td>
</tr>
<tr>
<td>DAL</td>
<td>CHI</td>
<td>ATL</td>
<td>ARI</td>
<td></td>
</tr>
</tbody>
</table>
3.1.5 Constants

Three types of constants are allowed in FFSTC: integer, double, and string. All constants are capitalized.

Example:

```cpp
const MAXYARDS = 100;
```

3.1.6 Spatial Delimiters

Spatial delimiters in FFSTC are defined in the following table.

<table>
<thead>
<tr>
<th>Delimiter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(</td>
<td>Parenthesis</td>
</tr>
<tr>
<td>)</td>
<td></td>
</tr>
<tr>
<td>{</td>
<td>Braces</td>
</tr>
<tr>
<td>}</td>
<td></td>
</tr>
<tr>
<td>[</td>
<td>Brackets</td>
</tr>
<tr>
<td>]</td>
<td></td>
</tr>
<tr>
<td>;</td>
<td>Semicolon</td>
</tr>
<tr>
<td>:</td>
<td>Colon</td>
</tr>
<tr>
<td>,</td>
<td>Comma</td>
</tr>
<tr>
<td>.</td>
<td>Period</td>
</tr>
</tbody>
</table>

3.1.7 Operator Precedence

The following operators can be used in FFSTC and the following table indicates the operator precedence from highest to lowest order. The operators with equal precedence will be evaluated using the left to right associativity.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>() {} []</td>
<td>Parenthesis, Braces, and Bracket Operators</td>
</tr>
<tr>
<td>/ *</td>
<td>Multiplicative and Division Operators</td>
</tr>
<tr>
<td>+ -</td>
<td>Additive and Subtraction Operators</td>
</tr>
<tr>
<td>== &gt;= &lt;=</td>
<td>Relational Operators</td>
</tr>
<tr>
<td>!=</td>
<td>Negation Operator</td>
</tr>
<tr>
<td>&amp;&amp;</td>
<td></td>
</tr>
<tr>
<td>= /= *= += -=</td>
<td>Assignment Operators</td>
</tr>
</tbody>
</table>

3.1.8 Data Types

The following table shows the data types in FFSTC:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QB</td>
<td>int</td>
</tr>
<tr>
<td>RB</td>
<td>bool</td>
</tr>
<tr>
<td>KKR</td>
<td></td>
</tr>
<tr>
<td>TE</td>
<td></td>
</tr>
<tr>
<td>DEF</td>
<td></td>
</tr>
<tr>
<td>TeamName</td>
<td></td>
</tr>
</tbody>
</table>
3.2 Declarations

Declaring variables in FFSTC can take the following form:

QB myQuarterBack;
RB myRunningBack;

QB myQBRankings[10];
RB myRBRankings[10];

3.2.1 QB Type

The QB type will be associated with the statistical categories passYards, passTD, and passINT.

3.2.2 RB Type

The RB type will be associated with the statistical categories rushYards, rushTD.

3.2.3 WR Type

The WR type will be associated with the statistical categories rcvYards, rcvTD.

3.2.4 TE Type

The RE type will be associated with the statistical categories rcvYards, rcvTD.

3.2.5 KKR Type

The KKR type will be associated with the statistical categories FGMade, FGMiss.

3.2.6 DEF Type

The DEF type will be associated with the statistical categories defSACK, defINT.
3.3 Expressions

3.3.1 Mathematical Expressions

In FFSTC, expressions can be written to add statistical categories.

3.3.1.1 Multiplicative Expressions

\[\text{multiplicative-expression} \quad : \quad \text{attribute-expression} \quad | \quad \text{multiplicative-expression} \times \text{postfix-expression}\]

3.3.1.2 Divisions Expressions

\[\text{Division-expression} \quad : \quad \text{attribute-expression} \quad | \quad \text{Division-expression} \times \text{postfix-expression}\]

3.3.1.3 Additive Expressions

\[\text{additive-expression} : \text{multiplicative-expression} \quad | \quad \text{additive-expression} + \text{multiplicative-expression}\]

3.3.1.4 Subtraction Expressions

\[\text{Subtraction-expression} : \text{multiplicative-expression} \quad | \quad \text{additive-expression} - \text{multiplicative-expression}\]

3.3.2 Relational Expressions

\[\text{relational-expression} \quad : \quad \text{pack-expression} \quad | \quad \text{relational-expression} < \text{pack-expression} \quad | \quad \text{relational-expression} > \text{pack-expression} \quad | \quad \text{relational-expression} \leq \text{pack-expression} \quad | \quad \text{relational-expression} \geq \text{pack-expression} \quad | \quad \text{true} \quad | \quad \text{false}\]

3.3.3 Logical Expressions

\[\text{conditional-expression} : \text{logical-OR-expression} \quad | \quad \text{logical-OR-expression} : \text{logical-AND-expression} \quad | \quad \text{logical-OR-expression} || \text{logical-AND-expression} \quad | \quad \text{logical-AND-expression} \&\& \text{equality-expression} \quad | \quad \text{logical-AND-expression} : \text{equality-expression} \quad | \quad \text{equality-expression} == \text{relational-expression} \quad | \quad \text{equality-expression} != \text{relational-expression}\]
3.4 Statements
All statements in FFSTC must be written in the program body enclosed by “subbegin” and “subend.”

3.4.1 Conditional Statements
The following syntax denotes the if statement:

```c
if (expression)
{
  statement
}
else if (expression)
{
}
endif
```

3.4.2 Looping Statements
The following syntax denotes the while statement:

```c
while (expression)
{
  statement
}
endwhile
```

3.4.3 Print Statements
The printing for scoring statistics are handled through the build-in function $FFLPrint(x,y)$. Users may only use print statements to echo messages.

For Example:

```c
printf("Hello World.");
```
3.5 Scope

In FFSTC, all variables declared within the body of a function or statements are static. Variables declared prior to the program body will be global.
### 3.6 Built-in Functions

All Built-in functions in FFSTC begin with FFL.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FFLGetDatabase();</td>
<td>Required in the beginning of program. Without this declaration, FFSTC will not be able to obtain records.</td>
</tr>
</tbody>
</table>
| bool FFLSearch(Para1,Para2,Para3,Para4); | Search for the statistics for a specified position type by name and team and stores the value for position type. Returns true or false.  
Para1 ➔ Position Type  
Para2 ➔ Lastname  
Para3 ➔ Firstname  
Para4 ➔ Team Identifier  
For Example:  
QB myQB;  
bool isFound (false);  
isFound = FFLSearch(myQB, “Favre”, “Bret”, GB); |
| int FFLRetrieve(Para1,Para2,Para3,Para4); | Retrieve the statistics for a specified position type ranked highest by the statistic category type. The record will be stored into an array and the record with the highest ranking will be returned.  
Para1 ➔ Position Type  
Para2 ➔ Position Identifier  
Para2 ➔ statistic category  
Para3 ➔ number of records  
Para4 ➔ Team Identifier  
Example:  
QB myQBRankings[11];  
FFLRetrieve(myQBRankings, QB, passYards, 10); |
| FFLPrint(Para1, Para2); | Prints the statistics for a specified position type by the entire 2006 season or weekly.  
Para1 ➔ Position Type  
Para2 ➔ 0 denotes entire season, 1-17 denotes weeks 1 through 17.  
Example:  
@@ Prints my quarterback statistics for the entire 2006 season  
FFLPrint(MyQB, 0);  
@@ Prints my quarterback statistics for week 6  
FFLPrint(MyQB, 6);  
Options:  
Prints the statistics for a specified TeamName type by weekly only.  
Example:  
@@ Prints team scoring totals for week 11  
FFLPrint(myCustomTeam, 11); |
| TeamName Type = FFLFormulateTeam (Para1, Para2, Para3, Para4, Para5, Para6, Para7); | In a fantasy football league, a team consists of seven position types: QB, RB, WR, WR, TE, KKR, and DEF. This build-in function will create a team using specified position types and assign it to TeamName Type.  
Para1 ➔ QB Type  
Para2 ➔ RB Type  
Para3 ➔ WR Type 1  
Para4 ➔ WR Type 2  
Para5 ➔ TE Type  
Para6 ➔ KKR Type  
Para7 ➔ DEF Type  
Example:  
TeamName myCustomTeam;  
myCustomTeam = FFLFormulateTeam(myQB, myRB, myWR1,myWR2, myTE, myKKR, myDEF); |
3.7 User-Defined Functions

Functions in FFSTC can be defined by users using the following C-like format:

```
<return type>? <identifier> (<Para1>, <Para2>, <Para3>, ...) 
{
   body
};
```

The return type can either be the following data types:

- QB
- TE
- Int
- RB
- DEF
- Bool
- KKR
- TeamName

Para1, Para2, and Para3 represent function parameters. The function must end with a semi-colon.
3.8 Sample Program

@@ #FFSTC indicates the beginning of the program

</tbody>
</table>
5 Architectural Design

The ffsto interpreter has the following components:

Lexer: scanning user inputs and program files into tokens
Parser: syntax analysis of program and AST conversion
Tree Walker: AST processing.
6 Test Plan

A Main program and an input file is created to test the parser and lexer.

The following command is used to compile ffstc:

```
% java antlr.Tool ffstc.g
```

After the java files have been generated, the following command compiles the java files:

```
% javac *.java
```

The following command starts the test:

```
% java Main < input.dat
```

After debugging errors, the following is printed:

```
ffstcmain myprogram statsint { w = 3 } ; statsint { x = 22 } ; statsint { y = 20 } ; statsint { z = 0 } ;
statsfunc myfunction ( statsint q ) statsint { p = 24 } ; subbegin myfunctionstatements q = 3 ;
subend subbegin mystatements z = ( + x ( * y w ) ) ; if ( > z 10 ) x = z ; endif ; subend ffstcend
```

**Main.java**

```java
import java.io.*;
import antlr.CommonAST;
import antlr.collections.AST;
import antlr.debug.misc.ASTFrame;

public class Main {
    public static void main(String[] args) {
        try {
            DataInputStream input = new DataInputStream(System.in);
            ffstcLexer lexer = new ffstcLexer(input);
            ffstcParser parser = new ffstcParser(lexer);
            parser.program();
            CommonAST parseTree = (CommonAST)parser.getAST();
            System.out.println(parseTree.toStringList());
            ffstcTreeWalker walker = new ffstcTreeWalker();
            double r = walker.expression(parseTree);
            System.out.println("Value: "+r);
        } catch(Exception e) {
            System.err.println("exception: "+e);
        }
    }
}
```

7 Lessons Learned

An important lesson that I learned while working on this project is that writing a compiler can be very challenging when the specifications are not clearly defined, especially for someone working on this project individually. This is definitely a learning experience considering that java is not my primary language of expertise. As a CVN student, it was detrimental that I was not able to interact with other students. I would recommend a student taking this class in the future to be on campus.

7.1 Advice for future teams

I would recommend students taking this class in the future to be on campus because the interaction with students, teaching assistants, and professors can be critical when working on a project of this magnitude.
8 Appendix

8.1 Code Listing for each module

Main.java

```java
import java.io.*;
import antlr.CommonAST;
import antlr.collections.AST;
import antlr.debug.misc.ASTFrame;

public class Main {
    public static void main(String[] args) {
        try {
            FileInputStream fileInput = null;
            DataOutputStream fileOutput = null;

            for (int i=0;i<=5;i++)
            {
                String statsInputFile = "";
                String statsOutputFile = "";

                if (i==0)
                {
                    statsInputFile = "QBStats.csv";
                    statsOutputFile = "QBStats.html";
                }
                else if (i==1)
