C History

Developed between 1969 and 1973 along with Unix

Due mostly to Dennis Ritchie

Designed for systems programming

- Operating systems
- Utility programs
- Compilers
- Filters

Evolved from B, which evolved from BCPL
C History

Original machine, a DEC PDP-11, was very small:

24K bytes of memory, 12K used for operating system

Written when computers were big, capital equipment

Group would get one, develop new language, OS
Adding Two Numbers

```c
int add() /* Function that returns an integer */ {
    int x, y, z; /* Variables x, y, and z are integers */
x = 38; /* Set x to 38 */
y = 4; /* Set y to 4 */
z = x + y; /* Set z to the sum of x and y */
return z; /* Return z as the result of add() */
}
```

End statements with semicolons

Text between /* and */ is ignored (a comment)

Programs are mostly function definitions and global variables.
Variables

Names must start with a letter; may contain letters, numbers, and underscores.

```
a A a_variable aVariable a50 ex 12_  /* OK */
two-words 42_is_the_answer  /* BAD */
```

Must be declared before they’re used

```
int a, b, c; /* 32-bit signed binary integers */
char c, d;  /* Single letter, digit, etc. */

a = 42;
b = 18;
f = 3;    /* BAD: f not declared */
c = '0';
d = '#';
q = '4';  /* BAD: q not declared */
```
Types of Integers

```c
int a;       /* 32 bits: -2147483648 to 2147483647 */
unsigned b;  /* 32 bits: 0 to 4294967295 */
short c;     /* 16 bits: -32768 to 32767 */
unsigned short d; /* 16 bits: 0 to 65535 */
signed char e; /* 8 bits: -128 to 127 */
unsigned char f; /* 8 bits: 0 to 255 */
```
Constants

```c
#define ROWS 10
#define COLUMNS 40

pos = y * COLUMNS + rows;
```

This turns into

```c
pos = y * 40 + rows;
```

The “#” must be in the leftmost column.
int a, b, c;

a = b + c;    /* Addition */
a = b - c;    /* Subtraction */
a = -(b + c); /* Negation */
a = b * c;    /* Multiplication */
a = b / c;    /* Division (integer result) */
a = b % c;    /* Remainder (modulus) */
a = b < c;    /* a is non-zero if b is less than c */
a = b > c;    /* non-zero if b is greater than c */
a = b <= c;   /* b less than or equal to c */
a = b >= c;   /* b greater than or equal to c */
a = b == c;   /* a is non-zero if b is equal to c */
a = b != c;   /* a is non-zero if b different than c */
Assignment Operators

A convenient shorthand:

```plaintext
a += 3;  /* Increase a by 3 */
a = a + 3; /* Equivalent */
b *= 2;  /* Double b */
b = b * 2; /* Equivalent */
```

Most operators have assignment variants.
Bitwise Operators

Internally, numbers represented in binary.

\[
10100101_2 = 1 \times 2^7 + 0 \times 2^6 + 1 \times 2^5 + 0 \times 2^4 + 0 \times 2^3 + 1 \times 2^2 + 0 \times 2^1 + 1 \times 2^0
\]
\[
= 128 + 32 + 4 + 1
\]
\[
= 165_{10}
\]

Bitwise operators work directly on bits:

\[
\begin{align*}
&10110 \quad \& \quad 10011 \\
&\text{AND:} \quad 10010 \\
&10110 \quad | \quad 10011 \\
&\text{OR:} \quad 10111 \\
&10110 \quad ^{\wedge} \quad 10011 \\
&\text{XOR:} \quad 00101
\end{align*}
\]
Increment/Decrement Operators

```c
a = a + 1; /* Common operation */
a += 1;     /* One shorthand */
a++;        /* Even more succinct */

for (i = 0; i < 10; i++) { /* Very common idiom */
    /* i = 0, 1, 2, ..., 9 */
}

a = 3;
b = a++; /* Postincrement: means b = 3; a = 4; */
b = ++a;  /* Preincrement: means a = 5; b = 5; */

a = 3;
b = a--; /* Postdecrement: means b = 3; a = 2; */
b = --a;  /* Predecrement: means a = 1; b = 1; */
```
The If-Else Statement

```java
if (a == 3) {
    c = 2; /* Runs if a is 3. One statement: braces optional */
}

if (b == 4 && c == 2) {
    c = 5; /* Runs if b is 4 and c is 2 */
    a = a + 3;
} /* Two statements: braces mandatory */

if (a > b) {
    c = 1; /* Runs if a is greater than b */
} else {
    c = 5; /* Runs if a is not greater than b */
}

if (a > b || c == 3) { /* || is logical OR */
    c = 5; /* Runs if a is greater than b or c is 3 */
} else {
    a = b + 2;
}
```
The Switch Statement: A Multiway Conditional

```c
switch (a + 1) {
    case 2:
        c = 8; /* Runs if a is 1 */
        b = 2;
        break;
    case 0:
    case 1: /* Multiple cases allowed */
        b = 3; /* Runs if a is -1 or 0 */
        break;
    case 42: /* Case labels need not be contiguous */
        c = 12;
        /* No break: falls through to next case! */
    case 4:
        c = 15; /* Runs if a is 3 or 41 */
        break;
    default: /* a default is optional */
        c = 0; /* Runs if no other case matches */
        break; /* Good style */
}
```
The While Statement

```c
int gcd(int a, int b)
{
    while (a != b) { /* Repeat while a and b are different */
        if (a > b)
            a -= b; /* a is larger; subtract b from it */
        else
            b -= a; /* b is larger; subtract a from it */
    }
    return a;
}
```
The For Statement

/* Sum the numbers from 1 to n */
int sumup(int n)
{
    int i, s;
    i = 0;
    s = 0;
    while (i <= n) {
        s += i;
        i += 1;
    }
    return s;
}

/* Sum the numbers from 1 to n */
int sumup(int n)
{
    int i, s;
    s = 0;
    for (i = 0 ; i <= n ; i += 1)
    {
        s += i;
        return s;
    }
int i;
int a[10];        /* Array of 10 integers */
int b[] = { 2,3,7,6 }; /* Initial values */

a[0] = 3;
a[2] = 5;
a[9] = 18;
a[10] = 42;    /* BAD: only a[0] ... a[9] */
a[-1] = 2;      /* BAD: positive indexes only */

a[1] = b[0];    /* a[0] = 2 */
b[3] = 42;

i = 5;
a[i] = 42;      /* a[5] = 42; */
i = 4;
a[i] = 10;      /* a[4] = 10; */
Strings

/* Strings are null-terminated arrays of characters */

char name1[] = "Stephen";
/* is equivalent to */
char name2[] = {'S', 't', 'e', 'p', 'h', 'e', 'n', 0};

name1[5] = 'a';

/* name1 now "Stephan" */
struct point { /* Define an aggregate type "struct point" */
    int x;
    int y;
};

struct point p;  /* Declare a new point */
p.x = 10;         /* Set its coordinates */
p.y = 15;

printf("(%d,%d)\n", p.x, p.y);

struct point q = { 320, 200 }; /* Initialize contents */
p = q;            /* Copy one point to another */

struct rect {  
    struct point southwest;
    struct point northeast;
};

struct rect r;
r.southwest.x = 10;
r.southwest.y = 5;
r.northeast.x = 125;
r.northeast.y = 200;
int num_calls = 0; /* global variable */

int power(int base, int n)
{
    int p; /* Different than main’s p */

    for ( p = 1 ; n > 0 ; --n )
        p *= base;

    num_calls++;

    return p;
}

int main() /* main function always runs first */
{
    int n, p;

    n = power(2, 5); /* n = 32 */
    p = power(3, 3); /* p = 27 */

    p = num_calls; /* p = 2 */
}
Pointers

```
int x = 1, y = 2;
int *ip;
```
Pointers

```
int x = 1, y = 2;
int *ip;

ip = &x;
```
Pointers

```
int x = 1, y = 2;
int *ip;

ip = &x;
y = *ip;
```
int  

x = 1, y = 2;
int  *ip;

ip = &x;
y = *ip;
*ip = 0;
Pointers

```c
void swap(int x, int y)
{
    int temp;
    temp = x;
    x = y;
    y = temp;
}
```

Does this work?
void swap(int x, int y)
{
    int temp;
    temp = x;
    x = y;
    y = temp;
}

void swap(int *px, int *py)
{
    int temp;

    temp = *px; /* get data at px */
    *px = *py;  /* get data at py */
    *py = temp; /* write data at py */
}

void main()
{
    int a = 1, b = 2;

    /* Pass addresses of a and b */
    swap(&a, &b);

    /* a = 2 and b = 1 */
}
Arrays and Pointers

int a[10];
Arrays and Pointers

```
int a[10];
int *pa = &a[0];
```
Arrays and Pointers

```
int a[10];
int *pa = &a[0];
pa = pa + 1;
```
Arrays and Pointers

```c
int a[10];
int *pa = &a[0];
pa = pa + 1;
pa = &a[1];
```
```c
struct point { 
  int x;
  int y;
};

struct point p, *pp;

p.x = 100;
p.y = 200;

pp = &p;     /* pp now points to p */

(*pp).x = 50; /* Assign to x field of p */
pp->x = 50;   /* Equivalent */
pp->y = 42;
```
Strlen: An Example

```c
int strlen(const char *s) {
    int n;
    for (n = 0 ; *s != '\0' ; s++)
        n++;
    return n;
}

void main()
{
    char ste[] = "Stephen";
    int l = strlen(ste);
}
```
Separate Compilation

**file1.c**

```c
extern void bar();
char a[] = "Hello";

int main() {
    bar();
}

void baz(char *s) {
    printf("%\%s", s);
}
```

**file2.c**

```c
extern char a[];
extern void baz(char *);

static char b[6];

void bar() {
    strcpy(b, a);
    baz(b);
}
```
Better Style: Header Files

**myfiles.h**

```c
#ifndef _MYFILES_H
#define _MYFILES_H

/* in file1.c */
extern void bar();
extern char a[];

/* in file2.c */
extern void baz(char *);

#endif
```

**file1.c**

```c
#include "myfiles.h"

char a[] = "Hello";

int main() {
    bar();
}

void baz(char *s) {
    printf("%\%%s", s);
}
```

**file2.c**

```c
#include "myfiles.h"

static char b[6];

void bar() {
    strcpy(b, a);
    baz(b);
}
```
