462 Computer Science Building
Schedule

Mondays and Wednesdays, 5:30 – 8:40 PM
627 Mudd
Lectures: July 8 – August 14
Final: August 14
Final project reports and presentations: August 16

Summer semester goes by very quickly.
Do everything as early as you can.
You will not have time to catch up.
Objectives

Theory of language design

- Finer points of languages
- Different languages and paradigms

Practice of Compiler Construction

- Overall structure of a compiler
- Automated tools and their use
- Lexical analysis to assembly generation
Alfred V. Aho, Monica S. Lam, Ravi Sethi, and Jeffrey D. Ullman.

Bug Al about all bugs.

You can get away with the first edition.
Assignments and Grading

50% Programming Project
40% Final
10% Individual homework

Project is most important, but most students do well on it. Grades for tests often vary more.
Prerequisites

COMS W3157 Advanced Programming

- Teams will build a large software system
- Makefiles, version control, test suites
- Testing will be as important as development

COMS W3261 Computer Science Theory

- You need to understand grammars
- We will be working with regular and context-free languages
Contains syllabus, lecture notes, and assignments.
Schedule may be updated
Collaboration

Collaborate with your team on the project.

Do your homework by yourself.

Don’t cheat on assignments (e.g., copy from each other): If you’re dumb enough to cheat, I’m smart enough to catch you.

Every term I’ve caught people cheating and sent them to the dean. Please try to break my streak.
Part I

The Project
Design and implement your own little language.

Five deliverables:

1. A proposal describing and motivating your language
2. A language reference manual defining it formally
3. A compiler or interpreter for your language running on some sample programs
4. A final project report
5. A final project presentation
Immediately start forming three-person teams to work on this project.

Each team will develop its own language.

All members of the team should be familiar with the whole project.
First Three Tasks

1. Decide who you will work with
   *You'll be stuck with them for the term; choose wisely.*

2. Elect a team leader
   *Languages come out better from dictatorships, not democracies. Besides, you’ll have someone to blame.*

3. Select a weekly meeting time
   *Harder than you might think.*
Project Proposal

Describe the language that you plan to implement.

Explain what problem your language can solve and how it should be used.

Describe an interesting, representative program in your language.

Give some examples of its syntax and an explanation of what it does.

2–4 pages
A careful definition of the syntax and semantics of your language. Follow the style of the C language reference manual (Appendix A of Kernighan and Ritchie, *The C Programming Language*; see the class website).
Final Report Sections

1. Introduction: the proposal
2. Language Tutorial
4. Project Plan
5. Architectural Design
6. Test Plan
7. Lessons Learned
8. Complete listing
Due Dates

Proposal                      July 15 soon
Reference Manual             July 24
Final Report                 August 16
Design a language?

A small, domain-specific language.

Think of awk or php, not Java or C++.

Examples from earlier terms:

Geometric figure drawing language
Matlab-like array manipulation language
Quantum computing language
Screenplay animation language
Escher-like pattern generator
Music manipulation language (harmony)
Web surfing language
Mathematical function manipulator
Simple scripting language (à là Tcl)
Two Common Mistakes to Avoid

Configuration File Syndrome

➤ Your language must be able to express *algorithms*, not just data.
➤ If your language looks like “a bird and a bird and a turtle and a pond and grass and a rock,” it has fallen victim to configuration file syndrome and needs to be changed.

Standard Library Syndrome

➤ The beauty of a language is its ability to express many different things by combining only a few.
➤ The standard library supplied by your language should be small or nonexistent. Instead, think about how you could express your standard library in your language.
➤ Aim for Legos, not Microsoft Word.
What I’m Looking For

Your language must be able to express different algorithms

➤ Avoid Configuration File Syndrome. Most languages should be able to express, e.g., the GCD algorithm.

Your language must consist of small pieces that can mix freely

➤ Avoid Standard Library Syndrome. For anything you provide in the language, ask yourself whether you can express it using other primitives in your language.

Your compiler must lower the level of abstraction from its input

➤ Don’t write a Java-to-Java translator. Make sure your compiler adds details to the output such as registers, evaluation order of expressions, stack management instructions, etc.
Part II

What’s in a Language?
Components of a language: Syntax

How characters combine to form words, sentences, paragraphs.

*The quick brown fox jumps over the lazy dog.*

is syntactically correct English, but isn't a Java program.

```java
class Foo {
    public int j;
    public int foo(int k) { return j + k; }
}
```

is syntactically correct Java, but isn't C.
Specifying Syntax

Usually done with a context-free grammar.

Typical syntax for algebraic expressions:

\[
expr \rightarrow expr + expr \\
| expr - expr \\
| expr * expr \\
| expr / expr \\
| digit \\
| (expr)
\]
Components of a language: Semantics

What a well-formed program “means.”

The semantics of C says this computes the $n$th Fibonacci number.

```c
int fib(int n)
{
    int a = 0, b = 1;
    int i;
    for (i = 1 ; i < n ; i++) {
        int c = a + b;
        a = b;
        b = c;
    }
    return b;
}
```

‘When I use a word,’ Humpty Dumpty said in rather a scornful tone, ‘it means just what I choose it to mean—neither more nor less.’

Semantics

Something may be syntactically correct but semantically nonsensical

*The rock jumped through the hairy planet.*

Or ambiguous

*The chickens are ready to eat.*
Semantics

Nonsensical in Java:

```java
class Foo {
    int bar(int x) { return Foo; }
}
```

Ambiguous in Java:

```java
class Bar {
    public float foo() { return 0; }
    public int foo() { return 0; }
}
```
Doing it formally is beyond the scope of this class, but there are basically two ways:

- **Operational semantics**
  Define a virtual machine and how executing the program evolves the state of the virtual machine

- **Denotational semantics**
  Shows how to build the function representing the behavior of the program (i.e., a transformation of inputs to outputs) from statements in the language.

Most language definitions use an informal operational semantics written in English.
Part III

Great Moments in Evolution
Assembly Language

Before: numbers
55  
89E5  
8B4508  
8B550C  
39D0  
740D  
39D0  
7E08  
29D0  
39D0  
75F6  
C9  
C3  
29C2  
EBF6  

After: Symbols

gcd: pushl %ebp
    movl %esp, %ebp
    movl 8(%ebp), %eax
    movl 12(%ebp), %edx
    cmpl %edx, %eax
    je .L9
    .L7: cmpl %edx, %eax
    jle .L5
    subl %edx, %eax
    .L2: cmpl %edx, %eax
    jne .L7
    .L9: leave
    ret
    .L5: subl %eax, %edx
    jmp .L2
Before

```fortran
gcd: pushl %ebp
    movl %esp, %ebp
    movl 8(%ebp), %eax
    movl 12(%ebp), %edx
    cmpl %edx, %eax
    je .L9
.L7: cmpl %edx, %eax
    jle .L5
    subl %edx, %eax
.L2: cmpl %edx, %eax
    jne .L7
.L9: leave
    ret
.L5: subl %eax, %edx
    jmp .L2
```

After: Expressions, control-flow

```fortran
10 if (a .EQ. b) goto 20
   if (a .LT. b) then
      a = a - b
   else
      b = b - a
   endif
   goto 10
20 end
```
COBOL

Added type declarations, record types, file manipulation

data division.
file section.
*   describe the input file
fd   employee-file-in
    label records standard
    block contains 5 records
    record contains 31 characters
    data record is employee-record-in.
01   employee-record-in.

Programming for the masses

```
10 PRINT "GUESS A NUMBER BETWEEN ONE AND TEN"
20 INPUT A$
30 IF A$ <> "5" THEN GOTO 60
40 PRINT "GOOD JOB, YOU GUESSED IT"
50 GOTO 100
60 PRINT "YOU ARE WRONG. TRY AGAIN"
70 GOTO 10
100 END
```

 Started the whole Bill Gates/Microsoft thing. BASIC was invented by Dartmouth researchers John George Kemeny and Thomas Eugene Kurtz.
Simula, Smalltalk, C++, Java, C#

The object-oriented philosophy

class Shape(x, y); integer x; integer y;
virtual: procedure draw;
begin
    comment - get the x & y coordinates -;
    integer procedure getX;
    getX := x;
    integer procedure getY;
    getY := y;

    comment - set the x & y coordinates -;
    integer procedure setX(newx); integer newx;
    x := newx;
    integer procedure setY(newy); integer newy;
    y := newy;
end Shape;
Efficiency for systems programming

```c
int gcd(int a, int b) {
    while (a != b) {
        if (a > b) a -= b;
        else b -= a;
    }
    return a;
}
```
Functional languages with a syntax

```
structure RevStack = struct
  type 'a stack = 'a list
exception Empty
val empty = []
fun isEmpty (s:'a stack):bool =
  (case s
    of [] => true
     | _  => false)
fun top (s:'a stack): =
  (case s
    of [] => raise Empty
     | x::xs => x)
fun pop (s:'a stack):'a stack =
  (case s
    of [] => raise Empty
     | x::xs => xs)
fun push (s:'a stack,x: 'a):'a stack = x::s
fun rev (s:'a stack):'a stack = rev (s)
end
```
Scripting languages: glue for binding the universe together
