Instructor

Prof. Stephen A. Edwards
sedwards@cs.columbia.edu
http://www.cs.columbia.edu/~sedwards/
462 Computer Science Building
Schedule

Mondays and Wednesdays, 4:10 – 5:25 PM

535 Mudd

Lectures: September 8 to December 8

Midterm: November 8

Final: December 13 (in-class)

Final project report: December 22

Holidays: November 1 (Election day)
Objectives

Theory of language design

- Finer points of languages
- Different languages and paradigms

Practice of Compiler Construction

- Overall structure of a compiler
- Automated tools and their use
- Lexical analysis to assembly generation
Required Text

Alfred V. Aho, Monica S. Lam, Ravi Sethi, and Jeffrey D. Ullman.

*Compilers: Principles, Techniques, and Tools.*

Bug Al about all bugs.

You can get away with the first edition.
Assignments and Grading

40% Programming Project
20% Midterm
30% Final
10% Individual homework

Project is most important, but most students do well on it. Grades for tests often vary more.
Prerequisites

COMS W3157 Advanced Programming

- Teams will build a large software system
- Makefiles, version control, test suites
- Testing will be as important as development

COMS W3261 Computability and Models of Computation

- You need to understand grammars
- We will be working with regular and context-free languages
Contains syllabus, lecture notes, and assignments.
Schedule will be continually updated during the semester.
Collaboration

Collaborate with your team on the project.  
Exception: CVN students do the project by themselves.  
Do your homework by yourself.  

Don’t cheat on assignments (e.g., copy from each other): If you’re dumb enough to cheat, I’m smart enough to catch you.  
Every term I’ve caught people cheating and sent them to the dean. Please try to break my streak.
Part I

The Project
The Project

Design and implement your own little language.

Five deliverables:

1. A proposal describing and motivating your language
2. A language reference manual defining it formally
3. A compiler or interpreter for your language running on some sample programs
4. A final project report
5. A final project presentation
Immediately start forming four-person teams to work on this project.

Each team will develop its own language.

All members of the team should be familiar with the whole project.

Exception: CVN students do the project by themselves.
First Three Tasks

1. Decide who you will work with
   *You’ll be stuck with them for the term; choose wisely.*

2. Elect a team leader
   *Languages come out better from dictatorships, not democracies. Besides, you’ll have someone to blame.*

3. Select a weekly meeting time
   *Harder than you might think. Might want to discuss with a TA you’d like to have so it is convenient for him/her as well.*
Describe the language that you plan to implement.

Explain what problem your language can solve and how it should be used.

Describe an interesting, representative program in your language.

Give some examples of its syntax and an explanation of what it does.

2–4 pages
A careful definition of the syntax and semantics of your language. Follow the style of the C language reference manual (Appendix A of Kernighan and Ritchie, *The C Programming Language*; see the class website).
Final Report Sections

1. Introduction: the proposal
2. Language Tutorial
4. Project Plan
5. Architectural Design
6. Test Plan
7. Lessons Learned
8. Complete listing

Design a language?

A small, domain-specific language.

Think of awk or php, not Java or C++.

Examples from earlier terms:

Geometric figure drawing language
Matlab-like array manipulation language
Quantum computing language
Screenplay animation language
Escher-like pattern generator
Music manipulation language (harmony)
Web surfing language
Mathematical function manipulator
Simple scripting language (à là Tcl)
Two Common Mistakes to Avoid

Configuration File Syndrome

- Your language must be able to express *algorithms*, not just data
- If your language looks like “a bird and a bird and a turtle and a pond and grass and a rock,” it has fallen victim to configuration file syndrome and needs to be changed

Standard Library Syndrome

- The beauty of a language is its ability to express many different things by combining only a few
- The standard library supplied by your language should be small or nonexistent. Instead, think about how you could express your standard library in your language.
- Aim for Legos, not Microsoft Word
Part II

What’s in a Language?
Components of a language: Syntax

How characters combine to form words, sentences, paragraphs.

The quick brown fox jumps over the lazy dog.

is syntactically correct English, but isn't a Java program.

```java
class Foo {
    public int j;
    public int foo(int k) { return j + k; }
}
```

is syntactically correct Java, but isn't C.
Specifying Syntax

Usually done with a context-free grammar.

Typical syntax for algebraic expressions:

\[
expr \rightarrow expr + expr \\
| expr − expr \\
| expr * expr \\
| expr / expr \\
| digit \\
| (expr)
\]
Components of a language: Semantics

What a well-formed program “means.”

The semantics of C says this computes the $n$th Fibonacci number.

```c
int fib(int n)
{
    int a = 0, b = 1;
    int i;
    for (i = 1; i < n; i++) {
        int c = a + b;
        a = b;
        b = c;
    }
    return b;
}
```

“When I use a word,” Humpty Dumpty said in rather a scornful tone, “it means just what I choose it to mean—neither more nor less.’

Semantics

Something may be syntactically correct but semantically nonsensical

_The rock jumped through the hairy planet._

Or ambiguous

_The chickens are ready to eat._
Semantics

Nonsensical in Java:

```java
class Foo {
    int bar(int x) { return Foo; }
}
```

Ambiguous in Java:

```java
class Bar {
    public float foo() { return 0; }
    public int foo() { return 0; }
}
```
Specifying Semantics

Doing it formally is beyond the scope of this class, but there are basically two ways:

- **Operational semantics**
  Define a virtual machine and how executing the program evolves the state of the virtual machine

- **Denotational semantics**
  Shows how to build the function representing the behavior of the program (i.e., a transformation of inputs to outputs) from statements in the language.

Most language definitions use an informal operational semantics written in English.
Part III

Great Moments in Evolution
Assembly Language

Before: numbers
55
89E5
8B4508
8B550C
39D0
740D
39D0
7E08
29D0
39D0
75F6
C9
C3
29C2
EBF6

After: Symbols

gcd: pushl %ebp
movl %esp, %ebp
movl 8(%ebp), %eax
movl 12(%ebp), %edx
cmpl %edx, %eax
je .L9
.L7: cmpl %edx, %eax
jle .L5
subl %edx, %eax
.L2: cmpl %edx, %eax
jne .L7
.L9: leave
ret
.L5: subl %eax, %edx
jmp .L2
FORTRAN

Before

```
gcd:     pushl %ebp
        movl %esp, %ebp
        movl 8(%ebp), %eax
        movl 12(%ebp), %edx
        cmpl %edx, %eax
        je   .L9
        .L7: cmpl %edx, %eax
            jle  .L5
            subl %edx, %eax
        .L2: cmpl %edx, %eax
            jne  .L7
        .L9: leave
            ret
        .L5: subl %eax, %edx
            jmp  .L2
```

After: Expressions, control-flow

```
10     if (a .EQ. b) goto 20
      if (a .LT. b) then
          a = a - b
          else
              b = b - a
      endif
      goto 10
20     end
```
Added type declarations, record types, file manipulation

```cobol
data division.
file section.
* describe the input file
fd employee-file-in
    label records standard
    block contains 5 records
    record contains 31 characters
    data record is employee-record-in.
01 employee-record-in.
    02 employee-name-in   pic x(20).
    02 employee-rate-in   pic 9(3)v99.
    02 employee-hours-in  pic 9(3)v99.
    02 line-feed-in       pic x(1).
```
LISP, Scheme, Common LISP

Functional, high-level languages

(defun gnome-doc-insert ()
  "Add a documentation header to the current function.
  Only C/C++ function types are properly supported currently."
  (interactive)
  (let ((c-insert-here (point)))
    (save-excursion
      (beginning-of-defun)
      (let ((c-arglist
              c-funcname
              (c-point (point))
              c-comment-point
              c-isvoid
              c-doinsert)
        (search-backward "(")
        (forward-line -2)
        (while (or (looking-at "^$")
                    (looking-at "^ *\)
                    (looking-at "^ \*"
                    (looking-at "^#"))
          (forward-line 1)))
      )))
APL

Powerful operators, interactive language, custom character set

[0] Z+GAUSSRAND N;B;F;M;P;Q;R

BASIC

Programming for the masses

10 PRINT "GUESS A NUMBER BETWEEN ONE AND TEN"
20 INPUT A$
30 IF A$ <> "5" THEN GOTO 60
40 PRINT "GOOD JOB, YOU GUESSED IT"
50 GOTO 100
60 PRINT "YOU ARE WRONG. TRY AGAIN"
70 GOTO 10
100 END

Started the whole Bill Gates/ Microsoft thing. BASIC was invented by Dartmouth researchers John George Kemeny and Thomas Eugene Kurtz.
The object-oriented philosophy

```java
class Shape(x, y); integer x; integer y;
virtual: procedure draw;
begin
  comment - get the x & y coordinates -;
  integer procedure getX;
  getX := x;
  integer procedure getY;
  getY := y;

  comment - set the x & y coordinates -;
  integer procedure setX(newx); integer newx;
  x := newx;
  integer procedure setY(newy); integer newy;
  y := newy;
end Shape;
```
Efficiency for systems programming

```c
int gcd(int a, int b) {
    while (a != b) {
        if (a > b) a -= b;
        else b -= a;
    }
    return a;
}
```
structure RevStack = struct
  type 'a stack = 'a list
  exception Empty
  val empty = []
  fun isEmpty (s:'a stack):bool =
    (case s
     of [] => true
      | _  => false)
  fun top (s:'a stack):=
    (case s
     of [] => raise Empty
      | x::xs => x)
  fun pop (s:'a stack):'a stack =
    (case s
     of [] => raise Empty
      | x::xs => xs)
  fun push (s:'a stack, x: 'a):'a stack = x::s
  fun rev (s:'a stack):'a stack = rev (s)
end
sh, awk, perl, tcl, python, php

Scripting languages: glue for binding the universe together

```bash
class() {
    classname='echo "$1" | sed -n '1 s/ *:.*$/p'
    parent='echo "$1" | sed -n '1 s/^.*: */p'
    hppbody='echo "$1" | sed -n '2,$p'

    forwarddefs="$forwarddefs
    class $classname;"

    if (echo $hppbody | grep -q "$classname()"); then
defaultconstructor=
else
defaultconstructor="$classname() {}"
fi
}
```
