Instructor and Schedule

Prof. Stephen A. Edwards
sedwards@cs.columbia.edu
http://www.cs.columbia.edu/~sedwards/
462 Computer Science Building

Lectures: Mondays and Wednesdays, 5:30 – 8:40 PM
May 27 - July 2
Final: Wednesday, July 1
Presentations: Thursday, July 2
Final project reports: Thursday, July 2

Summer semester goes by very quickly.
Do everything as early as you can.
You will not have time to catch up.
Objectives

Theory

- Principles of modern programming languages
- Fundamentals of compilers: parsing, type checking, code generation
- Models of computation

Practice: Semester-long Team Project

- Design and implement your own language and compiler
- Code it in the OCaml functional language
- Manage the project and your teammates; communicate
Quasi-required Text

Alfred V. Aho, Monica S. Lam, Ravi Sethi, and Jeffrey D. Ullman.

*Compilers: Principles, Techniques, and Tools.*

Bug Al about all bugs.

You can get away with the first edition.
Assignments and Grading

50% Programming Project
40% Final
10% Individual homework

Project is most important, but most students do well on it. Grades for tests often vary more.
Prerequisites

COMS W3157 Advanced Programming

- How to work on a large software system in a team
- Makefiles, version control, test suites
- Testing will be as important as development

COMS W3261 Computer Science Theory

- Regular languages and expressions
- Context-free grammars
- Finite automata (NFAs and DFAs)
Collaboration

Collaborate with your team on the project.

Do your homework by yourself.

Don’t be a cheater (e.g., copy from each other):
   If you’re dumb enough to cheat,
      I’m smart enough to catch you.

Every term I’ve caught cheaters and sent them to the dean. Please try to break my streak.
The Project
The Project

Design and implement your own little language.

Five deliverables:

1. A proposal describing your language
2. A language reference manual defining it formally
3. A compiler for it, running sample programs
4. A final project report
5. A final project presentation
Teams

Immediately start forming four-person teams

Each team will develop its own language

Assign each team member a specific role

<table>
<thead>
<tr>
<th>Role</th>
<th>Responsibilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manager</td>
<td>Timely completion of deliverables</td>
</tr>
<tr>
<td>Language Guru</td>
<td>Language design</td>
</tr>
<tr>
<td>System Architect</td>
<td>Compiler architecture, environ.</td>
</tr>
<tr>
<td>Verification &amp; Validation</td>
<td>Test plan, test suites</td>
</tr>
</tbody>
</table>
First Three Tasks

1. Decide who you will work with
   *You’ll be stuck with them for the term; choose wisely.*

2. Assign a role to each member
   *Languages come out better from dictatorships, not democracies.*

3. Select a weekly meeting time
   *Harder than you might think.*
Describe the language that you plan to implement.

Explain what sorts of programs are meant to be written in your language.

Explain the parts of your language and what they do.

Include the source code for an interesting program in your language.

2–4 pages
A careful definition of the syntax and semantics of your language.

Follow the style of the C language reference manual (Appendix A of Kernighan and Ritchie, *The C Programming Language*; see the class website).
## Final Report Sections

<table>

<tr>
<td>Conclusions</td>
<td>Team</td>
</tr>
<tr>
<td>Full Code Listing</td>
<td>Team</td>
</tr>
</tbody>
</table>
Due Dates

Proposal: June 3 soon
Reference Manual: June 15
Final Report: July 2
Design a language?

A small, domain-specific language: awk or PHP, not Java or C++.

Examples from earlier terms:
- Geometric figure drawing language
- Matlab-like array manipulation language
- Quantum computing language
- Screenplay animation language
- Escher-like pattern generator
- Music manipulation language (harmony)
- Mathematical function manipulator
- Simple scripting language (à lâ Tcl)
Three Common Mistakes to Avoid

Configuration File Syndrome

▶ Must be able to express *algorithms*, not just data
▶ E.g., a program like “a bird and a turtle and a pond and grass and a rock,” is just data, not an algorithm

Standard Library Syndrome

▶ Good languages express lots by a combining few things
▶ Write a standard library in your language
▶ Aim for Legos, not Microsoft Word

Java-to-Java Translator Syndrome

▶ A compiler mostly adds implementation details to code
▶ Your compiler’s output should not look like its input
▶ Try your best not to re-invent Java
What I’m Looking For

Your language must be able to express different algorithms

- Avoid Configuration File Syndrome. Most languages should be able to express, e.g., the GCD algorithm.

Your language should consist of pieces that can mix freely

- Avoid Standard Library Syndrome. For anything you provide in the language, ask yourself whether you can express it using other primitives in your language.

Your compiler must lower the level of abstraction

- Don’t write a Java-to-Java translator. Make sure your compiler adds details to the output such as registers, evaluation order of expressions, stack management instructions, etc.
What’s in a Language?
Components of a language: Syntax

How characters combine to form words, sentences, paragraphs.

*The quick brown fox jumps over the lazy dog.*

is syntactically correct English, but isn’t a Java program.

```java
class Foo {
    public int j;
    public int foo(int k) { return j + k; }
}
```

is syntactically correct Java, but isn’t C.
Specifying Syntax

Usually done with a context-free grammar.

Typical syntax for algebraic expressions:

\[
\begin{align*}
expr & \rightarrow expr + expr \\
    & \mid expr - expr \\
    & \mid expr \ast expr \\
    & \mid expr \div expr \\
    & \mid digit \\
    & \mid (expr)
\end{align*}
\]
Components of a language: Semantics
What a well-formed program “means.”

The semantics of C says this computes the \( n \)th Fibonacci number.

```c
int fib(int n)
{
    int a = 0, b = 1;
    int i;
    for (i = 1 ; i < n ; i++) {
        int c = a + b;
        a = b;
        b = c;
    }
    return b;
}
```

‘When I use a word,’ Humpty Dumpty said in rather a scornful tone, ‘it means just what I choose it to mean—neither more nor less.’

Semantics

Something may be syntactically correct but semantically nonsensical

The rock jumped through the hairy planet.

Or ambiguous

The chickens are ready to eat.
Semantics

Nonsensical in Java:

```java
class Foo {
    int bar(int x) { return Foo; }
}
```

Ambiguous in Java:

```java
class Bar {
    public float foo() { return 0; }
    public int foo() { return 0; }
}
```

Programming for the masses

```basic
10 PRINT "GUESS A NUMBER BETWEEN ONE AND TEN"
20 INPUT A$
30 IF A$ <> "5" THEN GOTO 60
40 PRINT "GOOD JOB, YOU GUESSED IT"
50 GOTO 100
60 PRINT "YOU ARE WRONG. TRY AGAIN"
70 GOTO 10
100 END
```

Invented at Dartmouth by John George Kemeny and Thomas Eugene Kurtz. Started the whole Bill Gates/ Microsoft thing.
The object-oriented philosophy

class Shape(x, y); integer x; integer y;
virtual: procedure draw;
begin
    comment - get the x & y coordinates -;
    integer procedure getX;
    getX := x;
    integer procedure getY;
    getY := y;

    comment - set the x & y coordinates -;
    integer procedure setX(newx); integer newx;
    x := newx;
    integer procedure setY(newy); integer newy;
    y := newy;
end Shape;
Efficiency for systems programming

```c
int gcd(int a, int b) {
    while (a != b) {
        if (a > b) a -= b;
        else b -= a;
    }
    return a;
}
```
Functional languages with types and syntax

```
structure RevStack = struct
  type 'a stack = 'a list
  exception Empty
  val empty = []
  fun isEmpty (s:'a stack):bool =
    (case s
     of [] => true
     | _ => false)
  fun top (s:'a stack): =
    (case s
     of [] => raise Empty
     | x::xs => x)
  fun pop (s:'a stack):'a stack =
    (case s
     of [] => raise Empty
     | x::xs => xs)
  fun push (s:'a stack, x: 'a):'a stack = x::s
  fun rev (s:'a stack):'a stack = rev (s)
end
```
sh, awk, perl, tcl, python, php
