1 Introduction

Nowaday, there are many photo editing software around the market, which provides friendly user interface to manipulate and edit the pictures easily. However, there are very few handy picture editing library or programming language. When software engineers want to develop the a photo editing related software, they often need to include several third party library into their project. We want to make a language that make photo editing software development more easier. Our Language --- PICEL provides user some easy way to store the picture. Also, our language has the built-in matrix operation, which make developer easy to build up the image processing function for the desired features. Moreover, PICEL also have the built-in convolution library, which produce some fantastic photo editing effect, for example, sharpen, blur, edge detection, etc. For this language manual we will introduce the grammar and syntax for this language.

2 Language Tutorial

2.1 Environment Setup

The compiler has been run on an Ubuntu 15.10 virtual machine. A link for downloading VirtualBox and the tutorial for setting up an Ubuntu virtual machine can be found [here¹](#). The downloading link for the ISO of Ubuntu 15.10 can be found [here²](#). After the installation, there are some packages for LLVM to be installed before compiling the compiler. Simply run the commands below.

```
$sudo apt-get install m4 clang-3.7 clang 3.7-doc libclang-common-3.7-dev libclang-3.7-dev libclang1-3.7 libclang1-3.7-dbg libllvm-3.7-ocaml-dev libllvm3.7 libllvm3.7-dbg lldb-3.7 llvm-3.7 llvm-3.7-dev llvm-3.7-doc llvm-3.7-examples llvm-3.7-runtime clang-modernize-3.7 clang-format-3.7 python-clang-3.7 lldv-3.7-dev liblldb-3.7-dbg opam llvm-runtime
```

Then initialize OCaml's package manager(OPAM) in your home directory:

```
$opam init  
$opam switch 4.02.1  
$eval $(opam config env)  
$opam install core batteries llvm yojson
```

Following that, clone PICEL repository from github (you may also need to install git, whose tutorial can be found [here³](#)).

```
$git clone https://github.com/aleextrax/PICEL.git
```

2.2 Using the Compiler

The following is a sample PICEL program named example.pic.

```
int main(){  
    print(42);  
    return 0;  
}
```

Compile this program using the command below.

```
$ ./picel.native < example.pic > example.ll
```

And the output is in the file example.ll which will run using the lli command.

```
$lli example.ll
42
```

It will return the result “42”.

The sample code shows some features of PICEL:

- The syntax for a main declaration is int main()
- Calling the built-in print function
- The function has a return value.

2.3 The basics PICEL tutorial

- **Creating your PICEL source file**

Create a new file called example.pic, and open it up.

- **Declaring a primitive variable**

PICEL supports integer(int), boolean(bool), character(char) types. You can declare a variable in the format: *type identifier*.

```
int a;
bool if_condition;
```

- **Assigning variables**

You can assign a legal value to a pre-defined variable.

```
a = 1;
if_condition = true;
a = true; /* fail: the value is illegal */
b = 1; /* fail: undeclared identifier b */
```

- **Declaring & assigning arrays**

You can define an array using similar method with defining a primitive variable. The length of the array must be pre-defined. The index of an array starts with zero. There are two ways to assign an array. You can do it by assigning value to each element of an array, or use braces.

```

int i[3];      /* declare an array */
i[0] = 1;      /* assign a value to the first element of the array */
i[1] = 2;
i[2] = 3;
i = {1,2,3};   /* assigning can be done in this way as well */

```

- **Declaring & assigning matrices**

Defining a matrix has no difference with defining an array. Please be cautious that the assigning element following the element in the first row and the first column is the element in the first row and the second column.

```

mat m[2][3]; /* declare a matrix */
m[0][0] = 10; /* assign a value to the first element of the matrix */
m = {1,2,3,4,5,6}; /* m[0][0]=1, m[0][1] = 2, m[0][2] = 3, m[1][0] = 4,
m[1][1] = 5 m[1][2] = 6 */

```

One thing to mention is that the kernel we use in convolution is a matrix.

- **Declaring & assigning pictures**

Defining a picture is similar to defining a primitive variable. But usually we assign a picture object with an already-existing image file using *load* function. However, you are still able to assigning the r, g, b value of each pixel in a picture.

```

pic p;
p = load("test.bmp"); /* assign pic p with a bitmap file in current directory */
p.r[0][0] = 255;
p.g[0][0] = 255;
p.b[0][0] = 255;    /* assign the value of the pixel in row 1, column 1 of the
pic p */

```

- **Defining functions**

C-like syntax function defining is easy to understand and use.

```

int func(int arg){
    return arg;
}

```

- **Convolution**

Doing convolution is quite a simple and enjoyable experience in PICEL. There are multiple ways you can complete this.

```
pic p;
```

```
mat kernel_a[5][5];
mat kernel_b[5][5];
mat kernel1[5][5];
mat kernel2[5][5];
convolution(p, kernel a);      /* you can do it in a function way */
p # kernel_b;                 /* you can also use a # */
p # kernel1 # kernel2;        /* you can do multiple convolutions in one line */
```

Now, let's have fun!

3 Language Reference Manual

3.1 Lexical Convention

This chapter talks about the lexical conventions in PICEL including comments and tokens. Those tokens are a collection of 4 types: identifiers, keywords, literals and operators. Punctuators, such as white space, is also described in this chapter.

3.1.1 Comments

PICEL supports the comment starting with /* and terminating with */. Once the comment starting character /* is seen, all the other characters will be ignored until the comment ending character */ is seen. Comments do not nest. The characters /* and */ in a string literal are not considered as comments. The content in /* and */ can be multiple lines.

```
/* This is a comment.  
And because it's long,  
it spans three lines. */
```

3.1.2 Identifiers

Identifiers are sequences of characters to describe the names of variables and functions. An identifier can include letters, digits and underscores(_). The first character of an identifier cannot be a digit. An identifier cannot be the same as a keyword , a boolean literal , an int literal or a null literal. The length of an identifier is limited to 256 characters. Uppercase and lowercase letters are distinct.

```
identifier_name = “[‘a-z’|’A-Z’|’_’]([‘a-z’|’A-Z’|’_’|’0-9’])*”
```

3.1.3 Keywords

The keywords listed in the chart below are reserved and cannot be used for any other purpose.

if	else	for	while	int	bool
char	void	mat	pic	return	main
true	false	not	and	or	delete

3.1.4 Types

3.1.4.1 Primitive Data Type

- **Int**
An integer can hold a number in 32 bit. The value of an integer can range from $-2,147,483,648(-2^{31})$ to $2,147,483,647(2^{31}-1)$. For a number used as a string, you should use type char.
- **bool**
Bool type is a binary logical value which can be either true or false. A bool can also be null. A bool takes up 1 bit.
- **char**
The type char is an 8-bit unsigned integer converted to char, i.e., a char object ranges from 0 to 255. Any integer i other than 0 to 255 will be converted to $(i \bmod 256)$. Any other characters will be rejected.
- **string**
A string is represented by two quotes, example: “hello world”.
Actually PICEL does not have string type, so there is no variable to contain a string defined by quotes. But our scanner does catch all those static strings. As a result, those static strings can be used as arguments for some built-in functions, like

```
pic a=load("flower.bmp");
/* Here load is a built-in function which gets a string as the name of the picture,
load the picture and return a pic structure */
```

3.1.4.2 Non-primitive Data Type

- **array**
An array is a data structure that holds one or more literals of the same type. The elements in an array are stored consecutively in the memory. An array can only have one dimension. The identifying number of an array begins at 0, not 1.

```
int NumArray[5];
NumArray = {1, 2, 3, 4, 5};
```

You can also define an array and assign values to each element of it.

```
int NumArray[5];
NumArray[3] = 4;
```

You can retrieve the element in an array using its identifying number.

```
NumArray[0];           /* 1 */
```

- **mat**

A mat is a two-dimensional array that holds one or more integers. Kernels used for convolution are also mats with 5 rows and 5 columns.

```
mat kernel[5][5];
kernel = { 0,0,0,0,0,
          0,0,0,0,0,
          0,0,1,0,0,
          0,0,0,0,0,
          0,0,0,0,0 };
kernel[2][3] = 5;           /* kernel = { 0,0,0,0,0,
                                0,0,0,0,0,
                                0,0,1,5,0,
                                0,0,0,0,0,
                                0,0,0,0,0 } */
kernel[2][2];             /* 1 */
```

- **pic**

A pic is a data structure we use in PICEL to store an image. The picture is stored in three matrices(arrays) indicating the RGB values of this image. And syntax “.r[x][y]” can be used to refer to the R(ed) value of pixel in position (x,y). In the same way, there are “.g[x][y]” and “.b[x][y]” to refer to the G(reen) and B(lue) value of pixels. Notice that coordinates start from 0. There are some examples:

```
/* Suppose there is a pic A with size 100*100 */
int x=A.r[0][0];           /* get the Red value of point (0,0), the first pixel */
A.g[1][1]=255;            /* set the Green value of point(1,1) to 255 */
int y=A.b[100][0];         /* Invalid since A is 100*100. So the boundary is 99*99 */
```

Picture type supports a series of specific functions such as lengthOf(), widthOf(), etc.

3.1.5 Operators & Expression

Operator is the special token that perform a special operation in the program. In this chapter we will introduce our operator in PICEL.

- **Arithmetic Operator**

PICEL provides some basic operators for arithmetic operation: addition, subtraction, multiplication, and division. Also, there are division and negation in PICEL too. Following are some examples to show you the functionality of the operators:

Operator	Description	Example Code
+	addition	x = 4 + 3; /* x = 7 */
-	subtraction	y = 5 - 2; /* y = 3 */
*	multiplication	z = 12 * 10; /* z = 120 */
/	division	w1 = 12 / 3; /* w1 = 4 */ w2 = 100 / 3; /* w2 = 33 */
++	self-increase	si++; /* si = si + 1 */
--	self-decrease	sd--; /* sd = si - 1 */
-(int var)	negation	a = -5; /* a = -5 */ b = -a; /* b = 5 */

- **Array Access Operator:**

In PICEL, array can be accessed with integer index starting from 0 base, the following sample code can show the how to access array in PICEL:

```
int arr[3] = {1, 2, 3};  
int a = arr[1]; /* a = 2 */
```

- **Logical Operators:**

Operator	Description	Example Code
and	conjunction	true and false; /* false */

or	disjunction	true or false; /* true */
not	negation	not false; /* true */

- **Comparison Operators:**

Operator	Description	Example Code
>	greater than	5 > 3; /* return true */ ‘a’ > ‘b’; /* return false */
<	smaller than	4 < 3; /* return false */ ‘a’ < ‘z’; /* return true */
>=	greater than or equal to	4 >= 4 /*return true */ 5 >= 4 /*return true */
<=	smaller than or equal to	4 <= 4 /* return true */ 4 <= 10 /* return false */
==	equal to	5 == 5 /* return true */ ‘a’ == ‘z’ /* return false */
!=	not equal to	‘a’ != ‘z’ /* return true */

- **Assignment Operators:**

Operator	Description	Example Code
=	assign value	int a; a = 5;

- **Matrix Manipulation Operators:**

Operator	Description	Example Code
#	convolution	pic_return = pic # kernel
=	Assign array	int a[100]; a={1,3,5,7,9}; /*now the first 5th elements of a is 1, 3, 5, 7, 9

		<p>The assign operator will assign the int list in the braces to the array from the beginning, namely $a[0]$. In the length of int list exceeds the size of array, it will lead to an error*/</p>
=	Assign matrix	<pre>mat a[10][10]; a={1,2,3,4,5,6,7,8,9,10,99,999}; /* now the first row of a is 1~10 and a[1][0]=99, a[1][1]=999 The assign operator will assign the int list to the matrix row by row, begin with 0. And in each row, from left to right. It will be more convenient to understand it if we just regard a n*m matrix as an n*m array */</pre>

- **Operator Precedence and Associative Property:**

When the program contains multiple operators , then expression will follow the operator precedence and associative property to read our code. For example, if we have a code in our program like “ $a + b * \text{foo}()$ ”, which will follow the rules below, in this part we follow a lot from C Language manual:

1. Function call and membership access operator expression
2. Unary Operator
3. Arithmetic Operator: Multiplication(*) & Division(/)
4. Matrix Manipulation Operator: #
5. Arithmetic: Addition(+) & Subtraction(-)
6. Logical Operator: Greater-than(>), less-than(<), greater-than-or-equal-to(>=), and less-than-or-equal-to(<=)
7. Logical Operator: Equal-to(==) and not-equal-to(!=) expressions.
8. Logical AND expressions (and)
9. Logical OR expressions (or)
10. Conditional expressions, evaluated from left to right
11. All assignment expressions, evaluated right to left.
12. Comma Expression

3.2 Control Flow

In PICEL, there are two types of control flow syntax, namely Condition and Loop, which make program run into different branches according to the corresponding conditions. Control flow enables us to break up the flow of execution by utilizing conditions, looping and branching, making your program more flexible so that your program can conditionally execute particular block of code. With the help of control flow, we can build a complex program with a clear structure.

3.2.1 Block

In PICEL, if-block, for/while loop block and function block and function block all begin with “{” and end with “}”. This design is for the unification.

The forms of the block statement are:

```
if ( <condition> ) { <branch1> } else { <branch2> }
while ( <condition> ) { <statement> }
for ( <initialization>; <condition>; <modification> ) { <statement> }
```

3.2.2 Condition

Conditional control flow is the basic type. In the conditional control flow, program will either choose among two branches, or choose whether execute a branch or not, according to the given condition. Here is the syntax of conditional control flow.

```
if ( <condition> ) { <branch1> } [ else { <branch2> } ]
```

All conditional control flow must begin with “if (<condition>) {” and end with “}”. After “if”, there is <condition>, in which there is the condition of this control flow. All statements in <branch1> will be executed if and only if the condition is true.

And there is also an optional syntax “else”. It can be used to set the second branch of this conditional control flow. If the condition of this “if” control flow is false and there is an “else”, then <branch1> will be ignored and statements in <branch2> will be executed. If the condition of this “if” control flow is false and there is no an “else”, then <branch1> will be ignored and the program will keep executing the remaining statements.

- <condition>

The <condition> could be any expression which returns a result in boolean type, including simply a boolean variable and complex boolean expressions with lots of boolean operations.

- **else**

The “else” is an optional syntax of conditional control flow. And one “if” conditional control flow could have at most one “else” syntax. Since a “if” conditional control flow begins with “if” and “else” should follow the first branch which ends with “}”, a “else” control flow will match with the “if” which owns the closest “}”. And if this “if” already has a matching “else”, it is an error. The following code is an example of this error.

```
if (b == 1) {
    if (a > 0) {
        if (c > 0) {
            c = 1;
        }
        a = 0;
    }
    else /* match to the "if (a > 0)" */
    {
        a = -1;
    }
    else /* match to the "if (a > 0)" too, but that "if" already has a "else" */
    {
        /* so it leads to a compile error */
        a = -2;
    }
}
```

Again, the matching cannot cross functions.

- **<branch>**

The <branch> is a series of statements. Actually, <branch1> includes all statements between “{”, which follows <condition>, and “}” ,which is followed by “else” (or nothing if there is not “else”). <branch2> includes all statements between “else {” and “}”. As a result, a <branch> could just have a single statement or hundreds of statements with complex structure. Notice that, <branch> could contain all kinds of statements, including all control flow statements. Here is an example.

```
If (a > 0) {
    if (c > 10) {
```

```

        a = a + 1;
        c = c - 10;
    }
} else {
    a = 0;
    c = c * c;
}
b = a + c;
}

```

And inside <branch>, user could also define local variable. Those variables would only be available inside the corresponding branch.

3.2.3 Loop

In PICEL, we have two kinds of syntax for loop, namely “for” and “while”. Basically, they work in the similar way, but “for” provides a more convenient way to initialize a variable, set a terminal condition and change some variables in every iteration, just like how C++ does. The standard form for for-loop is as following.

```

for ( <initialization>; <condition>; <modification> ) {
    <statement>
}

```

A “for” loop begins with a statement “`for (<initialization>; <condition>; <modification>) {`” and ends with “`}`”. After “`for`”, there is a pair of parentheses which contains `<initialization>`, `<condition>`, and `<modification>` separated by semicolon. Between the left brace and right brace, there is the `<statement>` that loop will execute every iteration. Since the three sections in the parentheses is separated by semicolon, each section could only contain one statement. Here is an example code of for-loop.

```

s = 0;
for (int i = 1; i < 11; i = i + 1) {
    s = s + i; /* accumulate from 1 to 10 */
}

```

- **<initialization>**

The `<initialization>` section can be regarded as an extra component that will be executed before the program runs into the loop. As a result, we can do some initialization for the loop, like set a variable “`i`” to 1 to do a loop from 1 to 10.

In <initialization>, we can also define a new local variable which is only available in the for-loop.

- **<condition>**

The <condition> should be an expression which returns a boolean variable. Each time before the program enters the loop, it will check the <condition>. If the <condition> is true, it will begin the new iteration, otherwise it will quit the loop immediately. As a result, if the <condition> is false before the first iteration, the program will just pass the loop, but the <initialization> will be executed since it happens at the beginning. An example is as follows.

```
a = 1;  
b = 0;  
for (b = 1; a < 1; a = a + 1) { /* here b is set to 1 during <initialization> */  
    /* but <condition> is false, so program will not enter the loop and set b to 2 */  
    b = 2;  
}  
/* after those code, b = 1 and a = 1. */
```

- **<modification>**

The <modification> is the code that will be executed after each iteration, in another word, the modification will be executed after each time <statement> is finished. Basically it is used to modify the variable related to <condition>. And it's equivalent to set <modification> empty and put the same code in the <modification> at the end of <statement>. So the following two examples are equivalent.

```
for (int i = 1; i < 11; i = i + 1) {  
    s = s + i; /* accumulate from 1 to 10 */  
}  
for (int i = 1; i < 11;) {  
    s = s + i; /* accumulate from 1 to 10 */  
    s = i + 1;  
}
```

- **while (<condition>) { <statement> }**

The “while” is a simple version of “for”. As long as <condition> holds true, a “while” loop will repeat and execute <statement> repeatedly. It is easy to change a for-loop into a while-loop.

```
for ( <initialization>; <condition>; <modification> ) {  
    <statement>  
}
```

The above for-loop can be converted into while-loop as following.

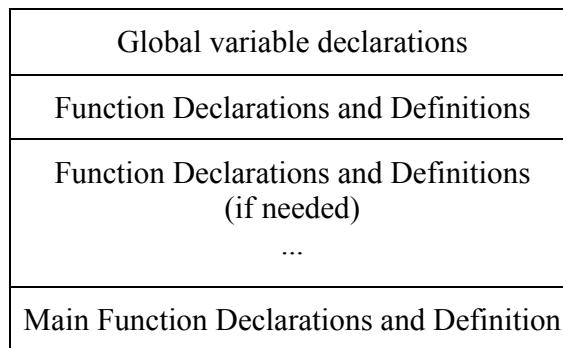

```
{  
    <initialization>  
    While ( <condition> ) {  
        <statement>  
        <modification>  
    }  
}
```

3.3 Program Structure and Scope

3.3.1 Program Structure

A PICEL program exist entirely within a single source file. By convention, source file (with a “.pic” extension) contains variable declaration, function declarations, and the corresponding definition.

The layout of a source file with a “.pic” extension is as following.

For example, if you write a function, and you want this function to be accessible to the main function or other functions, then you would put the function declaration and definition above the all functions that want to call it. Here is an example.

```
int copy_pic (int input) {
    if (input < 0) {
        return 0;
    }
    else If (input > 255) {
        return 255;
    } else {
        return input
    }
}

pic convolution(pic a, mat kernel) {
    ... /* omit some irrelevant code */
    for (int i = 0; i < a.w; i++) {
        for (int j = 0; j < a.h; j++) {
            tempr = tempg = tempb = 0;
            for (int x = 0; x < size; x++) {
```

```

        for (int y = 0; y < size; y++) {
            ... /* omit some irrelevant code */
        }
    }
    temp.r[i][j] = bound(tempr / tot);
    temp.g[i][j] = bound(tempg / tot);
    temp.b[i][j] = bound(tempb / tot);
}
... /* omit some irrelevant code */

}

mat kernel[5][5]
int main() {
    pic a;
    pic b;

    a = load("MARBLES.bmp");

    kernel[2][2] = 5

    convolution(a, kernel);
    save_file("target.bmp", a);

    ... /* omit some irrelevant code */
}

```

3.3.2 Function and Variable Scoping

Scope refers to what parts of the program can “see” a declared object, such as variable or function. A declared object can be visible only within a particular block, or within a particular function.

These are some rules for function and variable scoping.

1. All variables should be declared before being referenced.
 - a. Global variables must be declared without initial value will have a default value 0.
2. All functions should be declared(or defined) before being called.
3. The entry point of a PICEL program is the function declared as “main”
4. Variables of the inner block have higher precedence than the outer block.

3.3.3 Function Declaration Syntax

```
<return type> <function name>(<parameter list>
{
    <function content>
}
```

3.4 PIC and GRAPHIC LIBRARY

3.4.1 Basic PIC elements

- **width and height**

The structure of pic is similar to a structure in C++, so a pic's elements can be accessed by "dot". Syntax ".h" and ".w" are used to refer to the height and width of a pic.

```
/* assume there is a pic a */
int height=a.h; /* gets the height of a */
int width=a.w; /* gets the width of a */
```

- **RGB values**

And syntax ".r[x][y]" can be used to refer to the R(ed) value of pixel in position (x,y), which is stored as unsigned char. In the same way, there are ".g[x][y]" and ".b[x][y]" to refer to the G(reen) and B(lue) value of pixels. All coordinates start from 0.

Examples:

```
/* Suppose there is a pic A with size 100*100 */
int x=A.r[0][0];      /* get the Red value at point (0,0), the first pixel and cast it
to an integer */
A.g[1][1]=255;        /* set the Gree value of point(1,1) to 255 */
int y=A.b[100][0];    /* Invalid since A is 100*100. So the boundary is 99*99 */
```

- **Assignment of pic**

For the statement "pic A=B" where "B" is some expressions which returns a pic. This assignment will assign all content of B to a new struct for A, including the height, width and the pointer to the bitmap data. If B is also a pic variable, then change on A's RGB values will also change B's RGB values, vice versa. Thus the assignment of pic must be used carefully.

To support normal "copy" assignment, we have special library function "copy_pic(A,B)" which will copy the content of pic B to A.

3.4.2 3rd-party Library

We leveraged an open-source library¹ to implement the functionality of bitmap read/write.

3.4.2.1 Native Built-in Functions (written in C)

These functions are written in C and will be compiled and linked with the PICEL output as an executable.

3.4.2.2 The structure to record a pic in C

```
struct pic {  
    unsigned int width;  
    unsigned int height;  
    unsigned int bytes_per_pixel;  
    unsigned char* data;  
};
```

In the C code, the pic contains 3 unsigned integers and a unsigned char pointer. Variables width and height are the width and height in number of pixel of that picture. bytes_per_pixel is an element only used in save_file and accessing RGB values in code-generation.

And the pointer data points to the memory which stores the RGB values.

3.4.2.3 Bitmap file operations:

- **Read**

```
struct pic load(char* filename)
```

The load function will load a picture whose name is the input string. It will allocate the memory for the corresponding RGB values and create a new pic structure for this picture. Th the data pointer of this new pic structure points to the allocated address.

After that, the function returns the pic structure.

Currently load function could only support 24-bit bmp file.

¹Bitmap Image Reader Writer Library

Author: Arash Partow - 2002

URL: <http://partow.net/programming/bitmap/index.html>

- **Write**

```
int save_file(char* filename, struct pic *src_pic)
```

The function `save_file` takes a string as the name of target file and a `pic` structure needed to be saved. The `pic` structure will be stored in 24-bit bmp format.

3.4.2.4 Picture operations:

- **New picture**

```
struct pic newpic(unsigned int height, unsigned int width)
```

Function `newpic` will return an empty `pic` structure which refers to a new empty picture of given height and width.

- **Free**

```
int delete_pic(struct pic *src_pic)
```

Since the data pointer of each `pic` structure points to a large memory space storing bitmap data, we need a method to free memory of unused picture. In PICEL, we haven't implemented an automatic garbage collection mechanism, instead, we provide a delete function, `delete_pic`, to free the memory of a `pic` structure. And in our compiler, we use a special syntax to call this function and the `delete_pic` is just an invisible function.

```
delete a; /* free the memory of the pointer for the pic a*/
```

The picture `a`'s bitmap memory will be freed, but its width, height will remain. After the free function, `a`'s pointer points to NULL. And if `a` is a new `pic` whose pointer is NULL, or its memory has already been freed, it just become a useless statement.

The `delete` keyword must be used carefully especially in the case of two `pic` objects sharing the same bitmap.

3.4.3 Picture Manipulation Functions (written in pic)

3.4.3.1 Convolution

```
pic convolution(pic a, mat kernel)
```

The convolution is the key function of the picture processing part of our language. Given a pic a and a matrix kernel (here kernel must be a 5*5 matrix), the function will do convolution on the pic a. After modifying the RGB values of a, the function returns the pic a.

The convolution method is widely used in picture processing area. Convolution can achieve blur, sharpen, edge detection and other picture processing methods by define a special kernel matrix.

We also support a special syntax “#” for convolution, the expression “a#kernel” is equivalent to the expression “convolution(a, kernel)”.

Though convolution will return a new pic structure, but its pointer points to the same memory as the input matrix, we could use the return pic as argument for the next convolution function which modifies on the same memory region. Thus we have a convenient way to write convolution:

```
a#kernel_1#kernel_2#kernel_3#kernel_4;  
/*
```

This is equivalent to the following statements:

```
a#kernel_1;  
a#kernel_2;  
a#kernel_3;  
a#kernel_4;
```

Or

```
convolution(a, kernel_1);  
convolution(a, kernel_2);  
convolution(a, kernel_3);  
convolution(a, kernel_4);
```

```
*/
```

3.4.3.2 Translate to gray scale picture

```
void to_bw(pic a)
```

The to_bw function will convert the RGB values of the input pic a into corresponding gray color by some calculation. Namely, for each pixel the

function will convert the RGB values into gray level and then create corresponding RGB values of the gray level.

3.4.3.3 Picture copy (different bitmap buffer)

```
void copy_pic(pic src, pic dst)
```

The copy_pic function is used to copy the picture from src to dst. dst must have the same size as src and has an available pointer (usually be done by use newpic on outside). Then, the RGB values will be copied into dst from src.

3.4.4 Other Built-in function

3.4.4.1 Print integer to console and start a new line

```
print(int)
/*
```

A char type cannot be used as arguments for this function directly.
But it can be assigned to an int type so that its value is extended to an int.
So we could use the following statements for some pic x.
int temp=x.r[i][j];
print(temp);
*/

3.4.4.2 Print string to console and start a new line

```
prints("string")
```

4 Project Plan

4.1 Planning & Testing Process

4.1.1 Planning Process

Our team met once a week as a team with our T.A. Julie Chien to make sure our process on the right track. Basically we are on an as-needed basis at least once a week. Besides, our program manager will report to T.A. about our progress for this week, which make the communication between our team and T.A. very smooth. We use Wechat to synchronize everyone's progress with each teammate. Also, we used Google Drive Shared Folder to co-work on proposal, LRM, and final report. For version control, we used Github to manage every feature we are developing right now. For the development plan, we set up several milestone on weekly basis to check our progress. Also, weekly based plan helps us to estimate and leverage time we have and the goal we have in our mind. In this way, we can avoid waste lot of time on developing some minor features and focus on the most important feature for our language. Also, we have group meeting twice a week to maintain our development process. Also, physical meeting helps us to communicate with each other transparently and smoothly. Everyone can know the progress very clearly.

4.1.2 Specification Process

We spend a lot of time to figure out what kind of language we should develop. At first, we want to build up a language specific for montage processing and compile it to C or Java. However, we find out the application for montage is very limited and cannot show some interesting thing for a programming language. Besides, a montage language doesn't have enough high level to show the feature of high level language. Therefore, we decide to change the direction from translating a high level language to C or Java to translating some low level language but specific for image processing to some very low level language like FPGA or LLVM. Fortunately, some of our teammate are very familiar with LLVM, which make us decide on this direction very quickly. As the result, we follow this goal and didn't change the direction at all from the beginning to the end of the semester.

4.1.3 Development Process

We basically set up internal deadline for all the development. Generally we set two weeks earlier before the course deadline and based on the internal deadline to set up

the milestone. For example, we set up the hello world deadline on the end of March, so we need to complete the basic scanner, parser, semantic checking and codegen for the hello world demo. Therefore the roadmap and the milestone is very clear and very easy to know what the team should achieve every week. Before the midterm, we spent most of time on the basic syntax design and took the half of the semester to build up the graphic related structure, library and testing. We keep developing the graphic library until the one week before the demo.

4.1.4 Testing Process

Throughout the development process we build up several tricky test case by ourselves. We basically develop the testing cases based on MicroC test cases. However, since MicroC doesn't support as much as we want, for example, MicroC doesn't support local variable declaration in random place in the program, we developed our testing case for the feature we want to support. For the syntax part, we basically comes up with several tricky cases first to make sure the semantic and codegen able to generate the right code or to reply the right error message to user. For the graphic part, we basically test the code part and use the human eye to check the picture effect.

4.2 Style Guide

The following outlines our style guide for OCaml, , Bash, and llvm.

4.2.1 OCaml

- 4 space indentation
- 80 character limit lines
- comments included if logic is at all confusing
- pattern matching: no pipe for first pattern case but pipe for all rest of cases
- “then” should follow “if” in same line
- “with” should follow “if” in new line
- “in” should follow “let” in new line

4.2.2 Version Control (Git)

- Generate new branch from master when implementing new feature branch
- Commit often to allow for easy rollback of work if necessary
- Every commit should make sure passing all old test.
- Delete old branch before generate new branch

4.2.3 Bash

- separate actions into discrete statements where possible
- one line per statement
- one space between each token

4.2.4 LLVM

- Since we generate the llvm code, basically we let our generated code follow the llvm coding standard.

4.3 Software development environment:

- Languages: OCaml, LLVM
- Programming Editor: Sublime, vim
- Version Control: Git, Github
- Documentation: Google Drive

4.4 Team Member Github Username / Email:

- Chia Hao Hsu: geniousisme
- Chih-Sheng Wang: alextrax
- Ruijie Zhang: rz2337
- Rui Lu: RuiLu
- Chang Liu: jxsdfzlc

4.5 Team Member Responsibility:

- Chia Hao Hsu: Project Management, Semantic Checking, Development Plan
- Chih-Sheng Wang: Codegen, System Architect, Graphic Library Preprocessor
- Ruijie Zhang: Codegen, AST Development, Graphic Library Implementation
- Rui Lu: Semantic Checking, Language Design, Parser & Scanner Design
- Chang Liu: Automatic Regressive Testing, Final Report Finalization

4.6 Git Commit History:

Mar 6, 2016 – May 10, 2016

Contributions to master, excluding merge commits

Contributions: **Commits** ▾

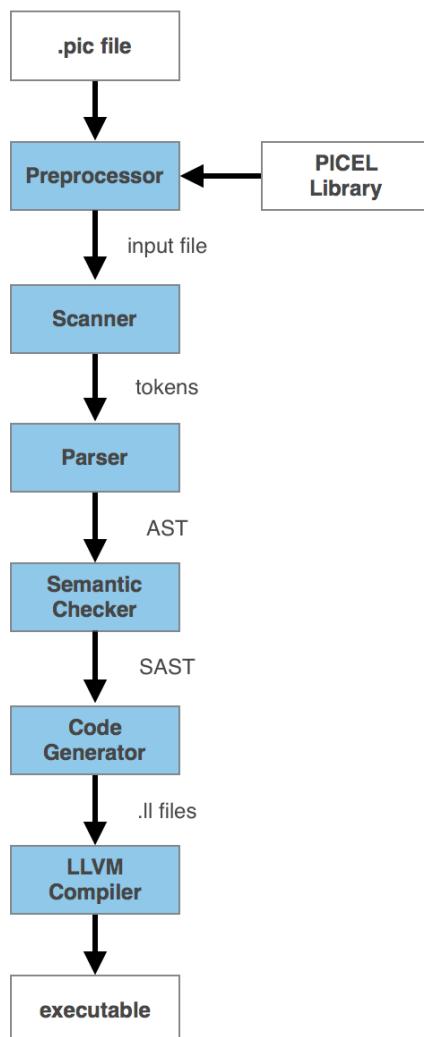

For full commit history please reference from appendix 2.

5 Architecture Design

5.1 Overview

The PICEL compiler takes a .pic file as source file, and then concatenates it with two PICEL library files, and finally creates a single .pic file as the input file. The compilers then feeds this input file through a series of steps which eventually convert the input file to the llvm code. Finally, the llvm bitcode will be translated into object code and linked with the bitmap library as an executable. All above processes can be performed by using a single script named “buildexe.sh”. After running the “buildexe.sh” script, we will get a resulting executable.

Here is a diagram to illustrate the process that how PICEL compiler works.

To give a quick overview of PICEL compiler, we first show you files we use to achieve the compiling process:

1. **scanner.mll**: Reads the input file and tokenize it to the corresponding tokens.
2. **parser.mly**: Reads in tokens from scanner to produce an AST as representation of the program.
3. **ast.ml**: AST representation of program after parser.
4. **semant.ml**: Semantically checks incomming AST representation of program to determine what the types of various values are, how thoese types interact in expressions, and whether those interactions are semantically reasonable.
5. **codegen.ml**: Converts a semantically checked AST into working LLVM code.
6. **convolution.pic**: Contains built-in function *copy_pic* which used to copy pic structures and *convolution* which runs convolution on given pic structure and 5*5 matrix.
7. **gray.pic**: Contains the function *to_bw* which convert a picture's color into gray level (but still stored as RGB values).
8. **picel.ml**: Main file (or main module) that calls on other files (or other modules) in the expected order.

5.2 Preprocessor

The preprocessor looks for PICEL library files by default and copies two library files, namely convolution.pic and gray.pic, into one input file. Then the source file is added to the tail of this single input file. We name the resultant file as source.pic. Finally, source.pic is fed to the compiler.

We achieve this by a script, which is as following:

```
cp ..../libpic/convolution.pic source.pic
cat ..../libpic/gray.pic >> source.pic
cat ./conv.pic >> source.pic
./picel.native < source.pic > tmp.ll
```

5.3 Scanner

The scanner is responsible for scanning through the input file and decomposing code of the input file into a series of prespecified tokens. During scanning, scanner will also discard meaningless token such as whitespace. After scanning through the entire input file, all scanned tokens are passed to the parser. Scanner can reduce the work

of the parser to simply understanding the structure of a program from tokens rather than the original source code.

5.4 Parser

The parser scans through the tokens passed by the scanner. The parser will construct an abstract syntax tree based on the parser.mly and the input tokens. If there is no prespecified rule on how to parse some certain tokens, the parser will throw a fatal error and the PICEL compiler stops. Different subtrees of the whole abstract syntax tree represents different component of the program. The parser passes the constructed abstract syntax tree to the semantic checker.

5.5 Semantic Checker

The semantic checker takes the abstract syntax tree as input. This abstract syntax tree is passed by the parser. The semantic checker first divides the given abstract syntax tree into two parts, which are globals and functions, which are stored in the format of List. Globals is used to store the declared global variables. And functions is used to store the codes of all functions declared and defined in the input .pic file. There are four subsections in the functions, namely func.typ, func.fname, func.formals, and func.body. Func.typ stores the return types of all functions, func.fname stores the names of all functions, func.formals stores the arguments declared in the prototype of each function, and finally, func.body stores the body of each function. Note that PICEL has built-in function, such as newpic, save, save_file, load, printb, print, and prints, therefore, the semantic checker will add these built-in functions into functions before the analysis phase.

Semantic checker then begins to semantically analyze on each statement and expression in each block of code in every function. This semantically analysis aims to ensure that functions are defined and don't have duplicate names, the types are consistent in every expression, variables are declared and in the proper scope, and variables are allowed to be declared only once in a certain scope. The semantic checker of PICEL uses five auxiliary data structures to ensure the correctness. First one is a list called local_hash_list which stores variables declared before the current block. The second one is a hash table called local_symbols which stores variables declared in the current block. The third one is a hash table called for_init_symbols which stores variables declared in the prototype of for-loop. The fourth one is a hash table called global_symbols which stores the global variables. The fifth one is a list called pic_attr which stores four attributes of PICEL-defined object -- pic. Taking

the following code as an example to show how this data structures cooperate with each other.

```
int a;
a = 10;
for (int i = 0; i < 10; i+=1) {
    print(a);
    print(i);
}
print(i);
```

The above code first declares a variable a, and assigns 10 to a, therefore, the variable a is store is local_symbols. When dealing with the for-loop, semantic checker finds that i is declared in the initialization section of for-loop, semantic checker will add variable i into for_init_symbols. When semantic checker continue checking <condition> and <modification> of for, it will first lookup for_init_symbols. When semantic checker enters the block of for-loop, all variables in local_symbols are added to the head of local_hash_list, then local_symbols will be cleared. Then all variables in for_init_symbols are combined with the current local_symbols, then for_init_symbols will be cleared. When semantic checker checks print(a), it will first lookup variable a in local_symbols, then in global_symbols, and finally in local_hash_list. The same check about variable i will be conducted when semantic checker checks print(i). When semantic checker leaves the block, local_hash_list returns its head to local_symbols, which stores all variables declared before this block. So when semantic checker checks print(i) outside the block, the semantic checker will throw an error because it cannot find any declaration information about i in all auxiliary data structures.

After the semantic checker checks all codes of the input file, it will return a semantic abstract syntax tree. The purpose of this new data structure is to provide the code generator with data without any syntax errors, so that the code generator can produce Llvm code successfully and flawlessly.

5.6 Code Generator

Code Generator will produce the Llvm code of the given syntax tree. According to the struct of abstract syntax tree, in the first level, code generator will evaluate the received declaration lists which contains both variable declarations and function declarations. In each function declaration, code generation will evaluate the statement list. And each statement is either a block of statement list or a syntax of special statement with several expressions needed to be evaluated.

During code generation, there are several features make things challenging.

The first feature is local variable. In PICEL, the definition of local variable is a statement that can appear anywhere a statement could appear. It comes with the challenge to store the mapping of variable name and Llvm address and create a function to look up the address given variable name. Fortunately, we find that Ocaml has a special type Hashtbl which could be assigned and modified instead of create a new binding. Consequently, we could define an empty Hashtbl mapping from string to llvalue and create a lookup function to look up the llvalue of given string. And for each definition of local variables, code generator first check whether the variable name is used and then add the binding into the Hashtbl. The Hashtbl is modified so that the lookup function still works.

And the scope of a local variable brings new troubles. The scope of a local variable begins with the statement of its definition and ends with the end of block it is defined (the statement list of a function is just a huge block) except the scope covered by another local variable in a inner block with the same name.

```
int a;
a=10;
{
    int b=a*10;
    int a=20;      /* Here another local variable a is defined
                      the first a becomes invisible*/
    int c=a;
    print(c);
}
/* Here the scope of second a ends. So the first a become available again*/
print(a);
```

In the example above, the green part is the scope of the first a and the gray part is the second a. As a result, we could not add the binding directly to the Hashtbl since it will remove the old binding which has larger scope. On the other hand, variables with same name cannot appear in the same block.

To deal with this problem, in Ocaml the function stmt to evaluate statements will receive a list of Hashtbl to store the binding in the outer blocks. And block becomes an intermediate level between function and statements. Another function handle_block is defined in the same level with stmt (let rec stmt ... and handle_block) to evaluate blocks.

At the beginning, there is just an empty list and a Hashtbl with the binding of function's parameters. And each Hashtbl will check whether variable's name has already appeared in itself for each binding. When occur a block, handle_block will evaluate it by adding the current Hashtbl into the list and evaluating statement list with stmt given the modified list and an empty Hashtbl using fold_left. Then in each block, the lookup function can turn to Hashtbl list to lookup local variables defined in outer blocks. And each Hashtbl is discarded when its corresponding block ends.

And the final problem happens when we want to access the address of matrix. In Ocaml, there is one-dimension array and two-dimensions matrix while both of them occupy a continuous memory. For a $n*m$ matrix a , to get or store the value of $a[i][j]$, we must access the address of the $i*m+j$ -th element. As a result, code generator must provide a way to get the type of a given variable name. It becomes complicated when we also consider the local-variable-problems we just talked above. However, we use a small trick to handle this trouble. Since each binding in Llvm will assign a local variable a unique llvalue, we add a Hashtbl mapping from llvalue to the types defined in ast.ml. Then searching the type becomes two steps, first get the llvalue by using a lookup function we discussed above, then use the llvalue to get the type of the variable. And this method also helps a lot when we deal with type conversion.

6 Testing Plan

6.1 Test suite

We composed our test cases originated from Microc's test cases. These test cases mainly belong to two groups: success tests and fail tests. Success tests are used to ensure that compiled PICEL programs are correctly operational, given the language specifications. Additionally, success tests are used to ensure that the semantic checker does not mistakenly throw errors for semantically correct programs. Fail tests are used to ensure that the semantic checker properly identifies semantic errors in PICEL programs and prohibits semantically incorrect programs from compiling. We named success tests with the prefix "test-" and fail tests with "fail-". All tests and their .out and .err files can be found in the tests/ directory.

Meanwhile we also designed some specific test cases for convolution. These tests are used to ensure some specific functions of convolution work well. The output of these tests are a.out files, which will generate corresponding .bmp files when executed. Those test cases can be found in the conv_tests/ directory.

6.2 Test automation

We modified some sections of Microc's test script testall.sh to build our test automation.

The main testing script looks through the test directory. It walks through all files and builds a .ll file or return the error message. It then runs the executable (if there is one) and compares the output (or the error message) to a pre-written .out file (or .err file). A difference between expected and actual output means failure. Such differences are recorded in .diff files. Specifying certain flags will clean up intermediate files and will only print the full list of results.

For convolution test cases, we made a buildexe.sh to run these test cases. It will copy conv.pic into a file named source.pic and catenate the source .pic file (e.g., test-conv1.pic) to the source.pic. Then it compiles source.pic and generate tmp.ll file. Run the file and we can have a.out file, which will generate the bitmap file we want when executed.

6.3 Source to target

source: source.pic

```
int gcd(int a, int b) {
    while (a != b) {
        if (a > b) a = a - b;
        else b = b - a;
    }
    return a;
}

int main()
{
    print(gcd(2,14));
    print(gcd(3,15));
    print(gcd(99,121));
    return 0;
}
```

target: source.ll

```
; ModuleID = 'PICEL'

}
```

7 Lesson learned

7.1 Chia-Hao Hsu

For me, there are two challenge to solve in this project: First, how to manage a project that I have no idea to process? Second, how to make sure there are no communication inconsistency between different group?

For the first challenge, it is actually quite hard for me to lead this project since I had no experience in LLVM and compiler. To solve this issue, I try to read several previous projects to figure out system architecture. Also, I asked my friends who took this course in last semester to know what scale we should achieve for this project.

For the second questions, it is actually quite hard to achieve communication inconsistency. Since every group has their own progress and sometime we forget to mention it for other group member, sometimes the semantic will forget to come up with the latest semantic checking with the newest codegen code. I think next time I should try TDD way to make sure every team is on the right track and all the testing case able to pass.

Last but not the least, I actually like ocaml very much. At first it looks very weird and hard to read, but after I am familiar with the syntax, I quite enjoy ocaml after I know all its basic syntax and logic in the language. I found that it is quite similar with the structure we need for building compiler. I am really glad I learned ocaml in this semester and open my horizon to the functional language.

7.2 Chih-Sheng Wang

Design and implement a new language is challenging since the early designed blueprint might not be well considered for later implementation. It's easy to encounter the dilemma between modifying the syntax or changing the plan for implementation. We use LLVM as our backend for code generation which further increases the difficulty of this project. Since LLVM IR is a low-level language, we need to deal with a lot of low-level issues such as type conversion and array index calculation. The picture oriented characteristic of our language implies high memory

usage as well as huge loading of memory debugging. Under such situation, the coding style is very important especially when dealing with memory buffers.

Another important thing I learnt from this project is the value of team working. Indeed, team working always brings extra communication cost and even more bugs due to the misunderstanding between the group members. However, once you find a way to conquer these problems, team working can also be an amazing experience. Working with different people offers you different perspectives and ideas which further enriches our work. I've also noted the it is almost impossible or less efficient to accomplish such a giant project without the help of my teammates.

7.3 Ruijie Zhang

Working a project is always scary to me because it is a long-term work and we need great project plan and time-management. I usually afraid of losing control of the workload and becoming extremely busy near the deadline. But fortunately, we did quite well since we always physical meet twice a week and set internal deadline as motivation. Yet, there are still some features that are abandoned due to the workload, perhaps we should have a better time schedule.

During the project, the first thing I learned is that things may not go as you planned, both good things and bad things. There are some troubles seem challenging at the first sight, but are easily handled after a few minutes. We used to regard local variables as a big deal since we assumed we need to change a bunch of codes and modify the logic of functions. However, it's much easier than we expected. On the other hand, we never thought dealing with array and matrix could be so depressed. When we tried to use array and matrix as arguments of a function, we found that it is impossible to get the size of an array or a matrix in our design unless we change the whole way we store array and matrix. Thus we gave it up and adopted a compromising approach which let the function only accept matrix with 5×5 size. Actually we could do much better if we had found the design flaw and fixed it at the very beginning. Instead of working recklessly, we should always take the future influence into account.

The second thing I learned a lot is communication. Different from other projects, this project requires us to design something new. Then we need to share our idea with other teammates instead of just following some pre-fixed rules. And it's not an easy work for me to show my thoughts clearly to others. Sometimes what I said is just different from what I thought. Indeed, this project helps me understand the importance of communication in huge projects.

7.4 Rui Lu

The PICEL project leaves me three valuable things: the knowledge of starting work early, the experience when cooperating with my brilliant teammates, and the technique to write elegant, functional and powerful programs in OCaml.

Starting working as early as possible gave my teammates and me a plentiful amount of time to fix any coding problems or correct the former mistakes in time. Nobody could exactly predict the problems that will appear during the process of completing a project, especially when we had to use a coding language which is totally different from those languages that we are familiar with. Noted that the LRM is slight different from the final project, because we found something cooler and more powerful after we discussed and experimented again and again, so we kept improving it. This time was earned by the “early start”. Besides, finishing the project early gave our more time to do more tests in order to prevent any potential bugs.

Instead of meeting once a week, we met twice a week, so that we were able to catch the latest progress and share ideas without delay. Even though we have a Wechat group, face-to-face meeting is necessary and more effective. In the beginning, I was unfamiliar with compiler, even some understandings were wrong. But the communication during meetings helped me correct mistakes and consolidate knowledge about compiler structure and OCaml coding skills. Conflicts happened sometimes. There was a time that Chris and I had different solutions for a problem, we discussed and compared each solution. Finally, we found Chris’s solution was way better than mine, so his solution was adopted. We learn from each other; we make progress together. The working experience with my teammate is so wonderful. I never used any functional language like OCaml before, so it was quite painful when I used OCaml to complete the first assignment. However, with increasing knowledge and continual practice, now I find OCaml is so powerful that I can achieve many functionalities within a few lines of code. Learning a functional language like OCaml is interesting.

7.5 Chang Liu

Working with great guys is really an amazing experience. An organized meeting plan (two times a week) makes our project plan works fluently. At first, I had no idea what a version control system is and made a lot of mistakes during the project. Fortunately, my teammates are patient enough and helped me out every time. I learned a lot from them, the way they debug, the way they think about and solve a

problem, the way they try to communicate their ideas, etc. Our TA Julie also gave us many useful suggestions on every phase of our project. I appreciate it a lot.

It's painful but interesting to come up with new tricky test cases. Sometimes I even didn't realize there is a problem in the code. One case is that defining and changing the value of variables of the same name in multiple nested blocks. It should prohibit the outer variable's using the value of the inner variable (which is determined by our rule of scoping), but our code actually didn't work in that way and I didn't even realize it. Fortunately, my teammate helped me to figure this out. Another headache is the problem is array and matrix overflow. This also consumed us a plenty of time. I also learned many technical details about what I learned from the course.

One more important lesson I learned from the project is that you should commit and pull timely if you use git as your version control system. And be very careful when doing push. I made mistakes on this and got punished.

8 Acknowledgements

We would like to thank our TA, Julie Chien, for helping us through this semester. She always answered our questions very fast and provided a lot of helpful advices to us. Also, we would like to thank to our professor for offering such a great course and cool project to let us have more understanding about the compiler technology.

9.2 Github History

commit 1297dac1829541c9f08ff7756c58eeac672359c6

Author: Chris Hsu <chia-hao.hsu@aiesec.net>

Date: Tue May 10 20:26:06 2016 -0400

Fix type identifier order

commit f0d6582833fa736c250101aff19454101de391a0

Author: Chris Hsu <chia-hao.hsu@aiesec.net>

Date: Sun May 8 14:23:51 2016 -0400

Add arr, matrix, pic assign val checking

commit b4fbadac2fabcefabcaca3d06936e54f1d1aa99d

Author: Chris Hsu <chia-hao.hsu@aiesec.net>

Date: Sun May 8 00:05:32 2016 -0400

Add source.pic & conv.pic test

commit f3859e92c7010b271cdede6186d050e339da7a42

Merge: 660d56e 450a1fc

Author: Chris Hsu <chia-hao.hsu@aiesec.net>

Date: Sun May 8 00:04:30 2016 -0400

Merge branch 'demo_merge' of https://github.com/alextrax/PICEL into demo_merge

commit 660d56e17d97c93295c2dac95d4abe94e83c869b

Author: Chris Hsu <chia-hao.hsu@aiesec.net>

Date: Sun May 8 00:04:18 2016 -0400

Add matrix, pic, rgb assign check

commit 450a1fc9fc10f76f64359707038fc64c45cf7169

Author: rz2337 <rz2337@columbia.edu>

Date: Sat May 7 16:01:55 2016 -0400

Added files via upload

32->24

commit 7e6aed397a6b5c560abd0689fc368bbddc7d4ff5

Author: rz2337 <rz2337@columbia.edu>

Date: Sat May 7 16:01:00 2016 -0400

Added files via upload

If that's what you want

commit dd723e52e3044557a8bff111d1923a0c91e10ddb
Merge: c4596dc 1befa45
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Sat May 7 15:59:48 2016 -0400

Merge branch 'demo_merge' of https://github.com/alextrax/PICEL into demo_merge

commit c4596dc221f94c3cc0909f8d05257cb5c2491b59
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Sat May 7 15:59:31 2016 -0400

Add assign rgbxy & pic

commit 1befa457b6462e3e0774b4372d1a990d17936fb5
Author: rz2337 <rz2337@columbia.edu>
Date: Sat May 7 15:55:54 2016 -0400

Added files via upload

Add bmp files for demo

commit 7701aee79af0f74cfb37e211465c578471cb72c5
Merge: 59dc591 75d9447
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Sat May 7 15:28:46 2016 -0400

Fix conflicts in semant

commit 59dc591f7fa7b314497879ffaad217334d22fc41
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Sat May 7 15:27:26 2016 -0400

Add rgb checker

commit 75d94471383fdd58194665f10b4e50014853a25f
Author: alextrax <cw2952@columbia.edu>
Date: Sat May 7 14:42:51 2016 -0400

Fix r g b check for pic

commit 8268fac126c3866a0897c33bc9c90012b5a98839
Author: alextrax <cw2952@columbia.edu>
Date: Sat May 7 14:11:51 2016 -0400

Update conv.pic

commit 32fb3ee33e81a4e1dece742f024b4509456cf91d
Merge: 8857b15 814206f
Author: alextrax <cw2952@columbia.edu>

Date: Sat May 7 14:06:18 2016 -0400

Merge branch 'demo_merge' of https://github.com/alextrax/PICEL into demo_merge

Author: Chris Hsu <chia-hao.hsu@aiesec.net>

Date: Tue Apr 12 13:39:25 2016 -0400

Add automatical tests

commit 0ff0a66c8e963cb1a3ad32506f05dbf690804b0d

Author: alextrax <luciferxiii@gmail.com>

Date: Fri Apr 8 22:11:28 2016 -0400

Bug fix:

1. Change passing of pic to save() function from pic_t to *pic_t
2. Fix global and local pic memory corruption issue
3. Now we can use loop to modify pixel value

commit 63936f9f28333fb1ec4a05a41285520010d0faa3

Author: alextrax <luciferxiii@gmail.com>

Date: Fri Apr 8 15:29:22 2016 -0400

Implement direct access RGB value by pic a; a.r[x][y]

FIXME:

1. loop causes segmentation fault
2. Global pic can not output picture correctly after printing pic attributes

commit 24c58abdb9604ea0cb4208169f462536724d951b

Author: alextrax <luciferxiii@gmail.com>

Date: Fri Apr 8 13:31:54 2016 -0400

Fix bug of string arg passed with pic

commit 6ed88c91741d51dad16f47919096388c70ac386b

Author: alextrax <luciferxiii@gmail.com>

Date: Fri Apr 8 12:27:31 2016 -0400

add temporary test folder

commit 2e9be13a965a7f26fbad774c5d4ab628b45e1c1e

Author: alextrax <luciferxiii@gmail.com>

Date: Fri Apr 8 11:47:06 2016 -0400

Add bmplib Makefile

commit d2ca944d859fefe431ef87c56828b05786a7b0cf

Author: alextrax <luciferxiii@gmail.com>

Date: Fri Apr 8 11:39:02 2016 -0400

Support save image

commit d527034eb7e21f0b83aac2523a7aa25b72027d3c

Merge: 468ff2e 49a455b

Author: Chris Hsu <chia-hao.hsu@aiesec.net>

Date: Fri Apr 8 11:16:41 2016 -0400

Merge remote-tracking branch 'origin/pointer' into semant_hello

commit 468ff2e6ab4b380d9bccde5fc39cce16e7a11215

Author: Chris Hsu <chia-hao.hsu@aiesec.net>

Date: Fri Apr 8 11:15:44 2016 -0400

Checkout for pointer first

commit 3951941a7d83c2f852a82b321e3150e84367b97a
Author: Chris Hsu <chia-hao.hsu@aisec.net>
Date: Fri Apr 8 11:09:37 2016 -0400

Add two tests for pic_tests for automatic tests

commit 17cadf7e936f267dd963702d2150cf5aa593f37c1
Author: RuiLu <rui0213@hotmail.com>
Date: Fri Apr 8 11:06:08 2016 -0400

Delete unnecessary files

commit 6ec3bd0106dbd95dc953630f294215ec2498d73c
Author: RuiLu <rui0213@hotmail.com>
Date: Fri Apr 8 11:05:17 2016 -0400

Delete old_semant

commit 196c2b6980f8fa2bb331aa18c7af7e0bf7a9d687
Merge: 473afb3 49a455b
Author: RuiLu <rui0213@hotmail.com>
Date: Fri Apr 8 11:02:07 2016 -0400

Merge branch 'pointer' of https://github.com/alextrax/PICEL into RuiLu

commit 29df45bed7b634eea46683428dfc64e85881e733
Merge: 700266c 473afb3
Author: Chris Hsu <chia-hao.hsu@aisec.net>
Date: Fri Apr 8 11:02:01 2016 -0400

Merge branch 'RuiLu' into semant_hello

commit 700266c28c6df5f750db6e31ee3fb595914bd731
Author: Chris Hsu <chia-hao.hsu@aisec.net>
Date: Fri Apr 8 11:01:10 2016 -0400

Modify the for init

commit 433117d897261fd8ebd49a24b8712c9aadadb538
Author: Chris Hsu <chia-hao.hsu@aisec.net>
Date: Fri Apr 8 10:58:15 2016 -0400

Update to_do.md

commit 473afb3123fcdff5e99d75c0c4caf9fb48868083
Author: RuiLu <rui0213@hotmail.com>

Date: Fri Apr 8 10:56:23 2016 -0400

Update README.md

commit fb48d91f637db8e49b4de657d1e3adb04e45ac36

Author: RuiLu <rlu0213@hotmail.com>

Date: Fri Apr 8 10:46:12 2016 -0400

Test

commit 072a6dfb42e477979dd3f44f25bff163bb2814e0

Author: Chris Hsu <chia-hao.hsu@aiesec.net>

Date: Fri Apr 8 10:44:55 2016 -0400

Update to_do.md

commit ab130c568b19ef3127368a2046df629160adca1b

Author: Chris Hsu <chia-hao.hsu@aiesec.net>

Date: Fri Apr 8 10:44:14 2016 -0400

Update to_do.md

commit f1556b91cb9a320aa370ddc605ecc5a1adf70f28

Author: Chris Hsu <chia-hao.hsu@aiesec.net>

Date: Fri Apr 8 10:43:53 2016 -0400

Create to_do.md

commit 0730517d95555de968ac44c6bef89d9cc1781ac2

Author: RuiLu <rlu0213@hotmail.com>

Date: Fri Apr 8 10:40:15 2016 -0400

Test for push without username and password

commit 11bf9e70ecdce9686c6173708741f65fc86ccacf

Author: RuiLu <rlu0213@hotmail.com>

Date: Fri Apr 8 10:35:32 2016 -0400

Support initialization in For.

commit c64a2ee34f3a1bab76185209d73c27b59a363495

Merge: 3c93a98 2491edb

Author: RuiLu <rlu0213@hotmail.com>

Date: Fri Apr 8 09:45:41 2016 -0400

New version on 04/08/16

commit 3c93a98a6b639884f02fe1b2cc5dc9cdb0f02fab

Author: RuiLu <rlu0213@hotmail.com>

Date: Fri Apr 8 09:40:08 2016 -0400

Semant for init and bind

commit 49a455b51352ca26e7d63285a5578281c7cc8417

Author: alextrax <luciferxiii@gmail.com>

Date: Fri Apr 8 01:06:55 2016 -0400

Implement load function for directly load bitmap into PICEL

commit 078ef31e084166069b25fc9e880837f4c8d86f07

Author: alextrax <luciferxiii@gmail.com>

Date: Fri Apr 8 00:20:06 2016 -0400

Support local PIC struct

commit 57eff0e9320bb10dfcc121130e2e10edfcfb4b72

Author: alextrax <luciferxiii@gmail.com>

Date: Fri Apr 8 00:08:43 2016 -0400

1. Support Global pic struct reference
2. Modify grammer to support pic.w, pic.h, pic.bpp, pic.data accessing

commit d6d3b0b099762e39a94061b3a87e1249affd3596

Author: alextrax <luciferxiii@gmail.com>

Date: Thu Apr 7 23:04:45 2016 -0400

Make PIC be a struct type { int width, int height, int bytes_per_pixel, char* data }

commit e8192595c77e16b60d5f92570c0e1cce801c4300

Author: alextrax <luciferxiii@gmail.com>

Date: Thu Apr 7 18:57:31 2016 -0400

1. Add bitmap library
2. implement get_width and get_height function

commit 25b7509064c1bb43c1e1ba848e4e690313b85bd2

Author: Chris Hsu <chia-hao.hsu@aiesec.net>

Date: Wed Apr 6 18:14:14 2016 -0400

Successfully support array in semant with Getarr & Assignarr

commit 2491edb27d727f99888325a8606f512ab9b3fa7c

Author: Chris Hsu <chia-hao.hsu@aiesec.net>

Date: Wed Apr 6 18:14:14 2016 -0400

Successfully support array

commit 56fac228040f6f66f0cb9750bad871f292daf6b9

Merge: 8270d5e e0138bd
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Wed Apr 6 17:59:59 2016 -0400

Support for & while, work on array now

commit 8270d5ee831870f1381e839023029d5ecbfff4f6
Merge: 6a64ee7 6951edc
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Apr 5 16:28:51 2016 -0400

Merge branch 'codegen_hello' into semant_hello

commit 6a64ee706ebb0af4f4a7eae27adcf71b95be213a
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Apr 5 16:25:28 2016 -0400

Modify the local initialization test

commit bfb4045212538c230524753c11fbe91da0f117bc
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Apr 5 16:24:34 2016 -0400

Successfully support local initialization

commit bf7f181a2b3fdbaf4717981a8c7e3508c0689394
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Apr 5 16:08:58 2016 -0400

Successfully support local varable binding

commit 80dcbf95ec6485691df8a062e8bc75547ea8e512
Author: RuiLu <rlu0213@hotmail.com>
Date: Tue Apr 5 16:05:29 2016 -0400

Bind in semant succeed

commit c071c3b4f7e07324f851ba1ada13a45af56c6d24
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Apr 5 15:34:27 2016 -0400

Start to change symbols from StringMap to Hashtbl

commit 8856bde83100b96c5cf0e3075b09ca708c45560
Author: RuiLu <rlu0213@hotmail.com>
Date: Tue Apr 5 15:32:15 2016 -0400

Before big change for semant.ml

commit e0138bd3de597f5045ab3c83baeaa55f1bb3df7f
Merge: 4053b40 3de41e3
Author: rz2337 <rz2337@columbia.edu>
Date: Tue Apr 5 15:25:26 2016 -0400

Merge branch 'array' of https://github.com/alextrax/PICEL into array

commit 4053b40475cbbd8c02b8664f55a72e5f7b592e30
Author: rz2337 <rz2337@columbia.edu>
Date: Tue Apr 5 15:25:00 2016 -0400

-modify codegen.mly to support formals

commit 3de41e38374c8376cbce0b94d9d4402b7e960e74
Author: alextrax <luciferxiii@gmail.com>
Date: Tue Apr 5 15:21:28 2016 -0400

Support local array declare and access

commit 2020e9a867641a133ede01d6e9c6beb0c2cb0a61
Author: RuiLu <rlu0213@hotmail.com>
Date: Tue Apr 5 14:01:02 2016 -0400

Correcting semantic

commit 36a9122fb6252014eee917b03c4e77b5f03dae3
Author: rz2337 <rz2337@columbia.edu>
Date: Sat Apr 2 14:54:20 2016 -0400

-modify codegen.mly to support local variables in different level of block.

commit 2969c6c5de52f4c16721f2c3781a98e51ce23bf1
Author: rz2337 <rz2337@columbia.edu>
Date: Sat Apr 2 12:19:39 2016 -0400

-modify ast.ml, parser.mly and codegen.ml to support for statement.
-rename the tokens used in "for_init"

commit c967fc645e91bfb53ca16a2b7bc871df5ae508f
Author: alextrax <luciferxiii@gmail.com>
Date: Fri Apr 1 22:11:01 2016 -0400

Support codegen for int array

commit 69fdf112006f37cd1e7a2ac5746f2bc790107140
Merge: 94327c2 04306dd
Author: RuiLu <rlu0213@hotmail.com>
Date: Fri Apr 1 16:28:42 2016 -0400

New version

commit 94327c2cc74302b8af8cca2026a853db7e6ca59c

Author: RuiLu <rlu0213@hotmail.com>

Date: Fri Apr 1 16:23:49 2016 -0400

Ready to add bind.

commit 04306dd30cd6b9764f1c03d8fd8cb9d5b7704213

Author: Chris Hsu <chia-hao.hsu@aisec.net>

Date: Fri Apr 1 16:14:59 2016 -0400

Add bind for symbols map, but not solving the assign issue yet

commit b62db2117181e8753b65e00117e68a9122e4612f

Author: Chris Hsu <chia-hao.hsu@aisec.net>

Date: Fri Apr 1 12:36:10 2016 -0400

Need to support bind & initial

commit a821b686b3592e6e7df734bbae1fc4feb00faea9

Author: rz2337 <rz2337@columbia.edu>

Date: Fri Apr 1 12:27:09 2016 -0400

Update README.md

commit f945cf03a0f0cd5be9fd28ac73e9c19aba58cbe0

Author: rz2337 <rz2337@columbia.edu>

Date: Fri Apr 1 12:26:32 2016 -0400

Create README.md

commit d2da447a713dec8ef83411d0b1d7ddfea9097bf9

Author: RuiLu <rlu0213@hotmail.com>

Date: Fri Apr 1 12:25:33 2016 -0400

New

commit adaeaae7f19e8b6d49eb85641ca99a4e7a83ef13

Author: rz2337 <rz2337@columbia.edu>

Date: Fri Apr 1 12:21:42 2016 -0400

-Again modify ast.ml and parser.mly to support assignment of array and get the value of array

commit 8eb68f7dff7c108301f91b5d7f1a7b4029572781

Author: alextrax <luciferxiii@gmail.com>

Date: Fri Apr 1 12:05:25 2016 -0400

Support Array declaration

commit 6e6ada44e2f9c68eeb29cf124beb598cc3c436b4
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Fri Apr 1 11:35:01 2016 -0400

Print hello world with semant & codegen combination

commit f8adaac9b5088b86d90dca8803343752d78d3d5b
Author: RuiLu <rui0213@hotmail.com>
Date: Fri Apr 1 11:10:24 2016 -0400

Current version, 04/01/2016

commit 6951edcd3b45a04a722117f268d1908c2c31860c
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Fri Apr 1 11:01:46 2016 -0400

Add print hello test cases

commit 38946017c291d071fc52d6135f0736cbe0273a55
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Fri Apr 1 10:57:52 2016 -0400

Checkout codegen_hello first

commit 89e18bc3aaa1ebe9d053d08ff42b3969c05fd601
Author: rz2337 <rui0213@columbia.edu>
Date: Fri Apr 1 10:52:17 2016 -0400

-Modify ast.ml and parser.mly to support array

commit 949556e23b87e56e93aac44b7dbdca7f32bd6987
Merge: 4093e20 159f2fc
Author: RuiLu <rui0213@hotmail.com>
Date: Fri Apr 1 10:50:16 2016 -0400

Useless

commit 4093e20b26583e564a95e247c841807c78ee8d8a
Author: RuiLu <rui0213@hotmail.com>
Date: Fri Apr 1 10:43:09 2016 -0400

My Parser

commit 77418e71810c76e79876e79e6f56b22cb69388c2
Merge: df0adcf 3ded196
Author: RuiLu <rui0213@hotmail.com>
Date: Fri Apr 1 10:42:03 2016 -0400

Test

commit 159f2fc06c70b8a9e72e1335b5e17ce70c00b0b3
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Fri Apr 1 10:40:02 2016 -0400

Delete llvm

commit 7cc092da0fd40ce2840db6b1cd8a88314d2669
Merge: feb22d8 d56d02f
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Fri Apr 1 10:38:30 2016 -0400

Test new gitignore

commit feb22d874575df05b991354351ed3bbbb2b84bdd
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Fri Apr 1 10:35:07 2016 -0400

Add hello test case for semant & codegen

commit d43a29da9b1acf800f7c8612baf46083819050ca
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Fri Apr 1 10:34:45 2016 -0400

Combine current codegen & ast

commit 128ceb801299cdb3511e71e8d0f6ccba720e77c7
Merge: e497174 3ded196
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Fri Apr 1 10:23:43 2016 -0400

Merge with Semant_hello ast & microc

commit e49717417b80619c6019d10020af9dbb8a01beed
Merge: e99d382 c5bdb2e
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Fri Apr 1 10:21:32 2016 -0400

Add print hello test caser

commit c5bdb2ef9cc92b1fb24fff937b794aadb0b49a47
Merge: e2bb98d 707122e
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Fri Apr 1 10:18:34 2016 -0400

Merge branch 'codegen_hello' of https://github.com/alextrax/PICEL into codegen_hello

commit 3ded196a9fd0ea141824e481efe1ee219811b58f

Author: Chris Hsu <chia-hao.hsu@aisec.net>
Date: Tue Mar 29 17:30:32 2016 -0400

Finish first version semantic check

commit 707122ea1b4a2087967313b22c43c72303281a88
Author: alextrax <luciferxiii@gmail.com>
Date: Tue Mar 29 16:57:35 2016 -0400

Add error message for hashtable lookup

commit df0adcf8dc8e0edd08f3bfdccfd989c5fc98c146
Author: RuiLu <rlu0213@hotmail.com>
Date: Tue Mar 29 16:46:42 2016 -0400

For_init

commit fa9d683cbfc81e781d07ab97aa404f8188b97878
Author: Chris Hsu <chia-hao.hsu@aisec.net>
Date: Tue Mar 29 16:45:33 2016 -0400

Start add for init

commit 4a02a17202a002eb487a9b8ab19dff6bd5463f3a
Author: alextrax <luciferxiii@gmail.com>
Date: Tue Mar 29 16:44:24 2016 -0400

1. Support codegen for local variable declaration and initialization
2. Use hashtable to implement variable table

commit 8c0cef9efc355f6903f6a33f28612d0230a7ecd1
Author: RuiLu <rlu0213@hotmail.com>
Date: Tue Mar 29 16:17:01 2016 -0400

Sement v1

commit 49a6fd58d60cdcd55bcccd8386eaa30c19694965
Author: RuiLu <rlu0213@hotmail.com>
Date: Tue Mar 29 15:43:28 2016 -0400

New version for checking semantics

commit 49099d4a92ec2ef3ac9b1602e43d629df1243f84
Merge: 2c64121 2db7ea7
Author: RuiLu <rlu0213@hotmail.com>
Date: Tue Mar 29 15:36:27 2016 -0400

Merge branch 'semant_hello' of https://github.com/alextrax/PICEL into RuiLu

commit 2c64121c0bff62d7b1fa64564093696851c808da
Merge: 6c26487 48228f3
Author: RuiLu <rlu0213@hotmail.com>
Date: Tue Mar 29 15:35:41 2016 -0400

..

commit 2db7ea79244f54fb07f4d0c8bb848bd6a6f655ef
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Mar 29 15:32:58 2016 -0400

Start editing semant.ml

commit 48228f3e56abec20fafab50893bd2d2aa08e340c
Author: rz2337 <rz2337@columbia.edu>
Date: Tue Mar 29 15:09:14 2016 -0400

Modification

-change notification of "Vdecl" <- No initialization in during variable declaration at "program" anymore.
-modify codegen, can set "vdecl" at global and use them now.
-modify microc.ml <-don't print ast, convenient for LLVM test.

commit e2bb98de4aa9c64c2b9985b37314f1fccbe47523
Merge: 96c0fa6 fb50722
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Mar 29 14:37:26 2016 -0400

Merge branch 'codegen_hello' of https://github.com/alextrax/PICEL into codegen_hello

commit 96c0fa6e723b95f9065c56663a8aceb3803eb4ec
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Mar 29 14:37:07 2016 -0400

Pull from codegen branch

commit fb50722770199fbe3d3ac5c5aaefabbd26a77cf4
Author: alextrax <luciferxiii@gmail.com>
Date: Tue Mar 29 14:36:51 2016 -0400

Support both print integer and string (user prints)

commit 2a0c43f4ecf53803e2a6975149732a8ca135f2be
Author: alextrax <luciferxiii@gmail.com>
Date: Tue Mar 29 12:04:05 2016 -0400

Support print 'Hello World'

commit 54d937f820929d4a9eb43672f0bfa3ef0bc52555

Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Fri Mar 25 12:32:35 2016 -0400

Add some test case

commit a61eca7173bafe08d0bad7a2a96975126a2e5f66
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Fri Mar 25 12:32:21 2016 -0400

Print integer successfully

commit 6c2648769a102faffc3878044a4d8c752e60b90a

WTF

commit 0cec38b5831d07c837703f6652aa47558384e5a3
Author: rz2337 <rz2337@columbia.edu>
Date: Fri Mar 25 12:01:18 2016 -0400

Add statements to print llvm

commit be513e2e8e58bc75fbc7618aac62a284f7e35b9c
Author: rz2337 <rz2337@columbia.edu>
Date: Fri Mar 25 11:55:31 2016 -0400

a small modification

commit d5fd0fd0a06a0f40259117541c0c090f81cbe21c
Author: rz2337 <rz2337@columbia.edu>
Date: Fri Mar 25 11:52:13 2016 -0400

try to modify code generation for "Hello World!"

commit ef44b01216fd727a2bc06961582fd4dd5091570d
Author: RuiLu <rlu0213@hotmail.com>
Date: Fri Mar 25 11:39:22 2016 -0400

Micro.ml v1

commit 252098a59310a53be1dce0dfdc763df858558fc
Author: RuiLu <rlu0213@hotmail.com>
Date: Fri Mar 25 11:15:49 2016 -0400

Test for branch

commit d56d02f1a9993b4889f99ac76b1e080ed31beda4

Merge: 4ba5307 e99d382
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Fri Mar 25 10:27:08 2016 -0400

Fix the conflicts

commit 4ba530761b54f258c4004c17752ebaa991369b26
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Fri Mar 25 10:24:21 2016 -0400

Clean file first

commit 0844eadb7d97a911b89584e4f5ead37f4cae45db
Author: alextrax <luciferxiii@gmail.com>
Date: Wed Mar 23 00:39:04 2016 -0400

Support AST tree printing

commit 91cc8f487aa468baa2bed5a7c7cb029cf1ee21fb
Author: alextrax <luciferxiii@gmail.com>
Date: Tue Mar 22 22:47:11 2016 -0400

Fix function declaration grammar by adding new rule for main():

```
fdecl:  
typ MAIN LPAREN formals_opt RPAREN LBRACE stmt_list RBRACE  
{ Fdecl({ typ = $1;  
fname = "main";  
formals = $4;  
body = List.rev $7 })}
```

commit e99d382bab8628a5ec56b2c45824b693d4d1f9b9
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Mar 22 19:40:59 2016 -0400

Delete llvm folder

commit f185398ce30e9db0d1739529e056d47dfd026b99
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Mar 22 19:29:01 2016 -0400

Perfect gitignore!

commit 4aadf22e459ba58f25578d88788284c5032a791b
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Mar 22 19:27:57 2016 -0400

WTF

commit 9e694f8a130f481086553cdbb63dc0cd9b1e14e3

Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Mar 22 19:24:55 2016 -0400

Finish compiling

commit e0609825848c9e3f92bfccac0cee9eedcb27f9d4e
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Mar 22 19:24:36 2016 -0400

Modify Makefile

commit c56337705f98b5ed5482c726657798297c3851fc
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Mar 22 19:24:20 2016 -0400

Ignore digests, logm microc.ml in _build

commit 72630270289e1be045b7626c3a78368d0af30a51
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Mar 22 19:08:58 2016 -0400

try to compile

commit 09be9afd7cab0a7503a3958056a4b274b48aeb8
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
Date: Tue Mar 22 19:03:59 2016 -0400

Fix the conflicts

commit 29eba1a37d4849c37207896db27580c8d61c0703
Merge: 737c18a 7ab1635
Author: Chris Hsu <chia-hao.hsu@aiesec.net>
