Programming Languages and Translators

Stephen A. Edwards

Columbia University

Spring 2017

Pieter Bruegel, *The Tower of Babel*, 1563
Facebook on 4115

Aho vs. Edwards for PLT?
Does anyone have strong opinions about either professor?
Thanks!

Like · Comment · Share

Stephen A. Edwards Definitely take it from Aho
November 17 at 1:54pm · Like · 👍 150

Sadly, Aho has retired from teaching 4115.

Edwards is the snarkiest, most sarcastic, immature professor you will meet in the CS department. He tells some really great nerdy jokes and his Facebook wall is hilarious since he belittles all his students publicly on it, but I don't recommend taking his class. Don't ever email him with an excuse or stupid question since he will publicly shame you (name removed though) on Facebook.
Objectives

Theory

- Principles of modern programming languages
- Fundamentals of compilers: parsing, type checking, code generation
- Models of computation

Practice: Semester-long Team Project

- Design and implement your own language and compiler
- Code it in the OCaml functional language
- Manage the project and your teammates; communicate
Recommended Text

Alfred V. Aho, Monica S. Lam, Ravi Sethi, and Jeffrey D. Ullman.

*Compilers: Principles, Techniques, and Tools.*

Bug Al about all bugs.

You can get away with the first edition.
Assignments and Grading

40%  Team Programming Project
20%  Exam 1
30%  Exam 2 (cumulative)
10%  Three individual homework assignments
0%   Effort*

Team project is most important, but most students do well on it. Grades for tests often vary more.

*Do or do not; there is no try —Yoda
Schedule

Lectures: Mondays and Wednesdays, 2:40 – 3:55
207 Mathematics
January 18 – May 1

Exam 1: March 8
Exam 2: May 1

Presentations: May 10*

Final Team project reports: May 10

* You can present before May 10. All team members must present.
Prerequisites

COMS W3157 Advanced Programming
- How to work on a large software system in a team
- Makefiles, version control, test suites
- Testing will be as important as coding

COMS W3261 Computer Science Theory
- Regular languages and expressions
- Context-free grammars
- Finite automata (NFAs and DFAs)
Collaboration

Collaborate with your team on the project.
Do your homework by yourself.

Don’t be a cheater (e.g., copy from each other):
   If you’re dumb enough to cheat,
      I’m smart enough to catch you.

Nearly every term I’ve caught cheaters and sent them to the dean. Please try to break my streak.
The Team Project
Design and implement your own little language.

Six deliverables:

1. A proposal describing your language
2. A language reference manual defining it formally
3. An intermediate milestone: compiling “Hello World.”
4. A compiler for it, running sample programs
5. A final project report
6. A final project presentation
Teams

Immediately start forming four-person teams
Each team will develop its own language
Each team member should participate in design, coding, testing, and documentation

Choose one team member to head specific tasks:

<table>

Culpa Suggestion

START EARLY, and really be selective in picking your team. A bad team will ruin the semester for you.
EVERY GROUP PROJECT

DOES 99% OF THE WORK

SAYS HE’S GOING TO HELP BUT HE’S NOT

HAS NO IDEA WHAT’S GOING ON THE WHOLE TIME

DISAPPEAR AT THE VERY BEGINNING AND DOESN’T SHOW UP AGAIN TIL THE VERY END

IN SCHOOL YOU HAVE EVERY DONE
When I die I want my group project members to lower me into my grave so they can let me down one last time.
How Do You Work In a Team?

If I knew, I’d use the knowledge to take over the world

- Address problems sooner rather than later
  If you think your teammate’s a flake, you’re right

- Complain to me or your TA as early as possible
  Alerting me a day before the project is due isn’t helpful

- Not every member of a team will get the same grade
  Remind your slacking teammates of this early and often

- I have forcibly split and dissolved teams
  If someone is really underperforming, dump his ass
What Google Learned From Its Quest to Build the Perfect Team

Things that *did not* matter

❌ Members’ intelligence
❌ Members’ experience
❌ Mix of personality types
❌ Whether the members were close friends
❌ Strong organization
❌ Gender balance

http://mobile.nytimes.com/2016/02/28/magazine/
what-google-learned-from-its-quest-to-build-the-perfect-team.html

https://hunterwalk.com/2016/09/03/
google-finds-that-successful-teams-are-about-norms-not-just-smarts/
What Google Learned From Its Quest to Build the Perfect Team

Things that *did* matter

Team “norms.” Unwritten rules of team interaction.

- That every team member spoke in the same proportion
- That team members had “social sensitivity”
  Empathy for fellow team members: the ability to read others’ feelings through void, expressions, etc.
First Three Tasks

1. Decide who you will work with
   You’ll be stuck with them for the term; choose wisely.

2. Assign a role to each member
   Languages come out better from dictatorships, not democracies.

3. Select a weekly meeting time
   Harder than you might think.
Describe the language that you plan to implement.

Explain what sorts of programs are meant to be written in your language

Explain the parts of your language and what they do

Include the source code for an interesting program in your language

2–4 pages
A careful definition of the syntax and semantics of your language.

Follow the style of the C language reference manual (Appendix A of Kernighan and Ritchie, *The C Programming Language*; see the class website).

Design a language?

A domain-specific language: awk or PHP, not Java or C++.

Examples from earlier terms:
Matlab-like array manipulation language
Geometric figure drawing language
Music manipulation language
Mathematical function manipulator
Simple scripting language (à lâ Tcl)
Three Common Mistakes to Avoid

Configuration File Syndrome

- Must be able to express *algorithms*, not just data
- E.g., a program like “a bird and a turtle and a pond and grass and a rock,” is just data, not an algorithm

Standard Library Syndrome

- Good languages express lots by a combining few things
- Write a standard library in your language
- Aim for Legos, not Microsoft Word

Java-to-Java Translator Syndrome

- A compiler mostly adds implementation details to code
- Your compiler’s output should not look like its input
- Try your best not to re-invent Java
What I’m Looking For

Your language must be able to express different algorithms

➤ Avoid Configuration File Syndrome. Most languages should be able to express, e.g., the GCD algorithm.

Your language should consist of pieces that can mix freely

➤ Avoid Standard Library Syndrome. For anything you provide in the language, ask yourself whether you can express it using other primitives in your language.

Your compiler must lower the level of abstraction

➤ Don’t write a Java-to-Java translator. Make sure your compiler adds details to the output such as registers, evaluation order of expressions, stack management instructions, etc.
What’s in a Language?
Components of a language: Syntax

How characters combine to form words, sentences, paragraphs.

*The quick brown fox jumps over the lazy dog.*

is syntactically correct English, but isn’t a Java program.

```
class Foo {
    public int j;
    public int foo(int k) { return j + k; }
}
```

is syntactically correct Java, but isn’t C.
Specifying Syntax

Usually done with a **context-free grammar**.

Typical syntax for algebraic expressions:

\[
\text{expr} \rightarrow \text{expr} + \text{expr} \\
| \text{expr} - \text{expr} \\
| \text{expr} \times \text{expr} \\
| \text{expr} \div \text{expr} \\
| \text{digit} \\
| (\text{expr})
\]
Components of a language: Semantics
What a well-formed program “means.”

The semantics of C says this computes the \( n \)th Fibonacci number.

```c
int fib(int n)
{
    int a = 0, b = 1;
    int i;
    for (i = 1 ; i < n ; i++) {
        int c = a + b;
        a = b;
        b = c;
    }
    return b;
}
```

‘When I use a word,’ Humpty Dumpty said in rather a scornful tone, ‘it means just what I choose it to mean—neither more nor less.’

Source: Lewis Carroll, Through the Looking Glass, 1872.
Semantics

Something may be syntactically correct but semantically nonsensical

*The rock jumped through the hairy planet.*

Or ambiguous

*The chickens are ready to eat.*
Nonsensical in Java:

```java
class Foo {
    int bar(int x) { return Foo; }
}
```

Ambiguous in Java:

```java
class Bar {
    public float foo() { return 0; }
    public int foo() { return 0; }
}
```

Backus, IBM, 1956

Imperative language for science and engineering

First compiled language

Fixed format lines (for punch cards)

Arithmetic expressions, If, Do, and Goto statements

Scalar (number) and array types

Limited string support

Still common in high-performance computing

Inspired most modern languages, especially BASIC

Alex Ford

99 Bottles of Beer in APL

Iverson, IBM, 1960
Imperative, matrix-centric
E.g., perform an operation on each element of a vector
Uses own specialized character set
Concise, effectively cryptic
Primarily symbols instead of words
Dynamically typed
Odd left-to-right evaluation policy
Useful for statistics, other matrix-oriented applications

T1←98↑[1]∅1 99π99
T4←∅1 98π98
T1,(98 30p’ BOTTLES OF BEER,
(98 47p’BOTTLES OF BEER, AROUND,’),T4,(98 28p’BOT

    printf("Take one down, pass it around,\n");
    if (--beers) sprintf(howmany, "%d", beers);
    else strcpy(howmany, "No more");
    s = beers != 1 ? "s" : ";";
    printf("%s bottle%s of beer on the wall.\n", howmany, s);
}
# 99 Bottles of Beer in C

```c
#define MAXBEER 99
void chug(int beers);

int main()
{
    int beers;
    for(beers = MAXBEER; beers;
        puts("\nTime to buy more beer!
        return 0;
    }

void chug(int beers)
{
    char howmany[8], *s;
    s = beers != 1 ? "s" : "";
    printf("%d bottle%s of beer on the wall,
            printf("%d bottle%s of beer . . . ,
            printf("Take one down, pass it around,
            if (--beers) sprintf(howmany, "%d",
            else strcpy(howmany, "No more");
            s = beers != 1 ? "s" : "";
            printf("%s bottle%s of beer on the wall.
    }
```

Dennis Ritchie, Bell Labs, 1969

Procedural, imperative

Based on Algol, BCPL

Statically typed; liberal conversion policies

Harmonizes with processor architecture

For systems programming: unsafe by design

Remains language of choice for operating systems

Functional languages with types and syntax

```haskell
structure RevStack = struct
  type 'a stack = 'a list
  exception Empty
  val empty = []
  fun isEmpty (s:'a stack):bool = 
    (case s
     of [] => true
      | _ => false)
  fun top (s:'a stack): = 
    (case s
     of [] => raise Empty
      | x::xs => x)
  fun pop (s:'a stack):'a stack = 
    (case s
     of [] => raise Empty
      | x::xs => xs)
  fun push (s:'a stack,x: 'a):'a stack = x::s
  fun rev (s:'a stack):'a stack = rev (s)
end
```
99 Bottles of Beer in Haskell

```haskell
bottles :: Int -> String
bottles n
  | n == 0 = "no more bottles"
  | n == 1 = "1 bottle"
  | n > 1 = show n ++ " bottles"

verse :: Int -> String
verse n
  | n == 0 = "No more bottles of beer on the wall, "
      ++ "no more bottles of beer.\n"
      ++ "Go to the store and buy some more, "
      ++ "99 bottles of beer on the wall."
  | n > 0 = bottles n ++ " of beer on the wall, "
        ++ bottles n
        ++ " of beer.\n"
        ++ "Take one down and pass it around, "
        ++ bottles (n-1) ++ " of beer on the wall.\n"

main = mapM (putStrLn . verse) [99,98..0]
```

Simon Johansson,
99 Bottles of Beer in Haskell

```haskell
bottles :: Int -> String
bottles n
    | n == 0 = "no more bottles"
    | n == 1 = "1 bottle"
    | n > 1 = show n ++ " bottles"

verse :: Int -> String
verse n
    | n == 0 = "No more bottles of beer on the wall, " ++ "no more bottles of beer."
    | n > 0 = bottles n ++ " of beer on the wall, " ++ bottles n ++ " of beer."
    | n > 0 = "Take one down and pass it around, " ++ bottles (n-1)

main = mapM (putStrLn . verse) [99,98..0]
```

Peyton Jones et al., 1990

Functional

Pure: no side-effects

Lazy: computation only on demand; infinite data structures

Statically typed; types inferred

Algebraic data types, pattern matching, lists, strings

Great for compilers, domain-specific languages, type system research

Related to ML, OCaml

Moore, NRAO, 1973
Stack-based imperative language
Trivial, RPN-inspired grammar
Easily becomes cryptic
Untyped
Low-level, very lightweight
Highly extensible: easy to make programs compile themselves
Used in some firmware boot systems (Apple, IBM, Sun)
Inspired the PostScript language for laser printers

Dan Reish,
The Whitespace Language

Edwin Brady and Chris Morris, April 1st, 2003

Imperative, stack-based language
Space, Tab, and Line Feed characters only
Number literals in binary: Space=0, Tab=1, LF=end
Less-than-programmer-friendly syntax; reduces toner consumption

Andrew Kemp, http://compsoc.dur.ac.uk/whitespace/
VisiCalc, Lotus 1-2-3, Excel

The spreadsheet style of programming
