1982: The IBM PC/XT
The ISA Bus: Memory Read
The ISA Bus: Memory Write
The PC/104 Form Factor: ISA Lives

Embedded System Legos. Stack ‘em and go.
Memory-Mapped I/O

- To a processor, everything is memory.
- Peripherals appear as magical memory locations.
- Status registers: when read, report state of peripheral
- Control registers: when written, change state of peripheral
**Typical Peripheral: PC Parallel Port**

**At Standard TTL Levels**

1. Write Data
2. Assert Strobe
3. Wait for Busy to clear
4. Wait for Acknowledge
A Parallel Port Driver

```c
#define DATA 0x378
#define STATUS 0x379
#define CONTROL 0x37A

#define NBSY 0x80
#define NACK 0x40
#define OUT 0x20
#define SEL 0x10
#define NERR 0x08
#define STROBE 0x01

#define INVERT (NBSY | NACK | SEL | NERR)
#define MASK (NBSY | NACK | OUT | SEL | NERR)
#define NOT_READY(x) ((inb(x)^INVERT)&MASK)

void write_single_character(char c) {
    while (NOT_READY(STATUS)) ;
    outb(DATA, c);
    outb(CONTROL, control | STROBE); /* Assert STROBE */
    outb(CONTROL, control ); /* Clear STROBE */
}
```
Interrupts and Polling

Two ways to get data from a peripheral:

- Polling: “Are we there yet?”
- Interrupts: Ringing Telephone
Basic idea:

1. Peripheral asserts a processor’s interrupt input
2. Processor temporarily transfers control to interrupt service routine
3. ISR gathers data from peripheral and acknowledges interrupt
4. ISR returns control to previously-executing program
Many Different Interrupts

What’s a processor to do?
Many Different Interrupts

What’s a processor to do?
ISR polls all potential interrupt sources, then dispatches handler.
Prioritizes incoming requests & notifies processor
ISR reads 8-bit interrupt vector number of winner
IBM PC/AT: two 8259s; became standard
