

# Data Science and Technology Entrepreneurship

Data Science for Your Startup  
Classification Algorithms  
Minimum Viable Product Development

Sameer Maskey  
Week6

# Announcements

- ▶ No class for next 2 weeks
  - ▶ March 11 week - NO Class - MBA students not on campus
  - ▶ March 18 week - NO Class - Spring break
- ▶ Extra Lectures
  - ▶ This Friday's lecture is cancelled

# Topics for Today

- ▶ Big Data
- ▶ Data Science for your Startup
- ▶ Linear Classifiers
  - ▶ Naive Bayes
  - ▶ Perceptron
- ▶ Minimum Viable Product Development

# Feedback

<http://www.surveymonkey.com/s/BFQJY79>

# Big Data

**30 billion** pieces of content shared  
on Facebook every month

**235** terabytes data collected by  
the US Library of Congress  
in April 2011

# Big Data - Value

**\$300 billion**

potential annual value to US health care—more than double the total annual health care spending in Spain

**€250 billion**

potential annual value to Europe's public sector administration—more than GDP of Greece

**\$600 billion**

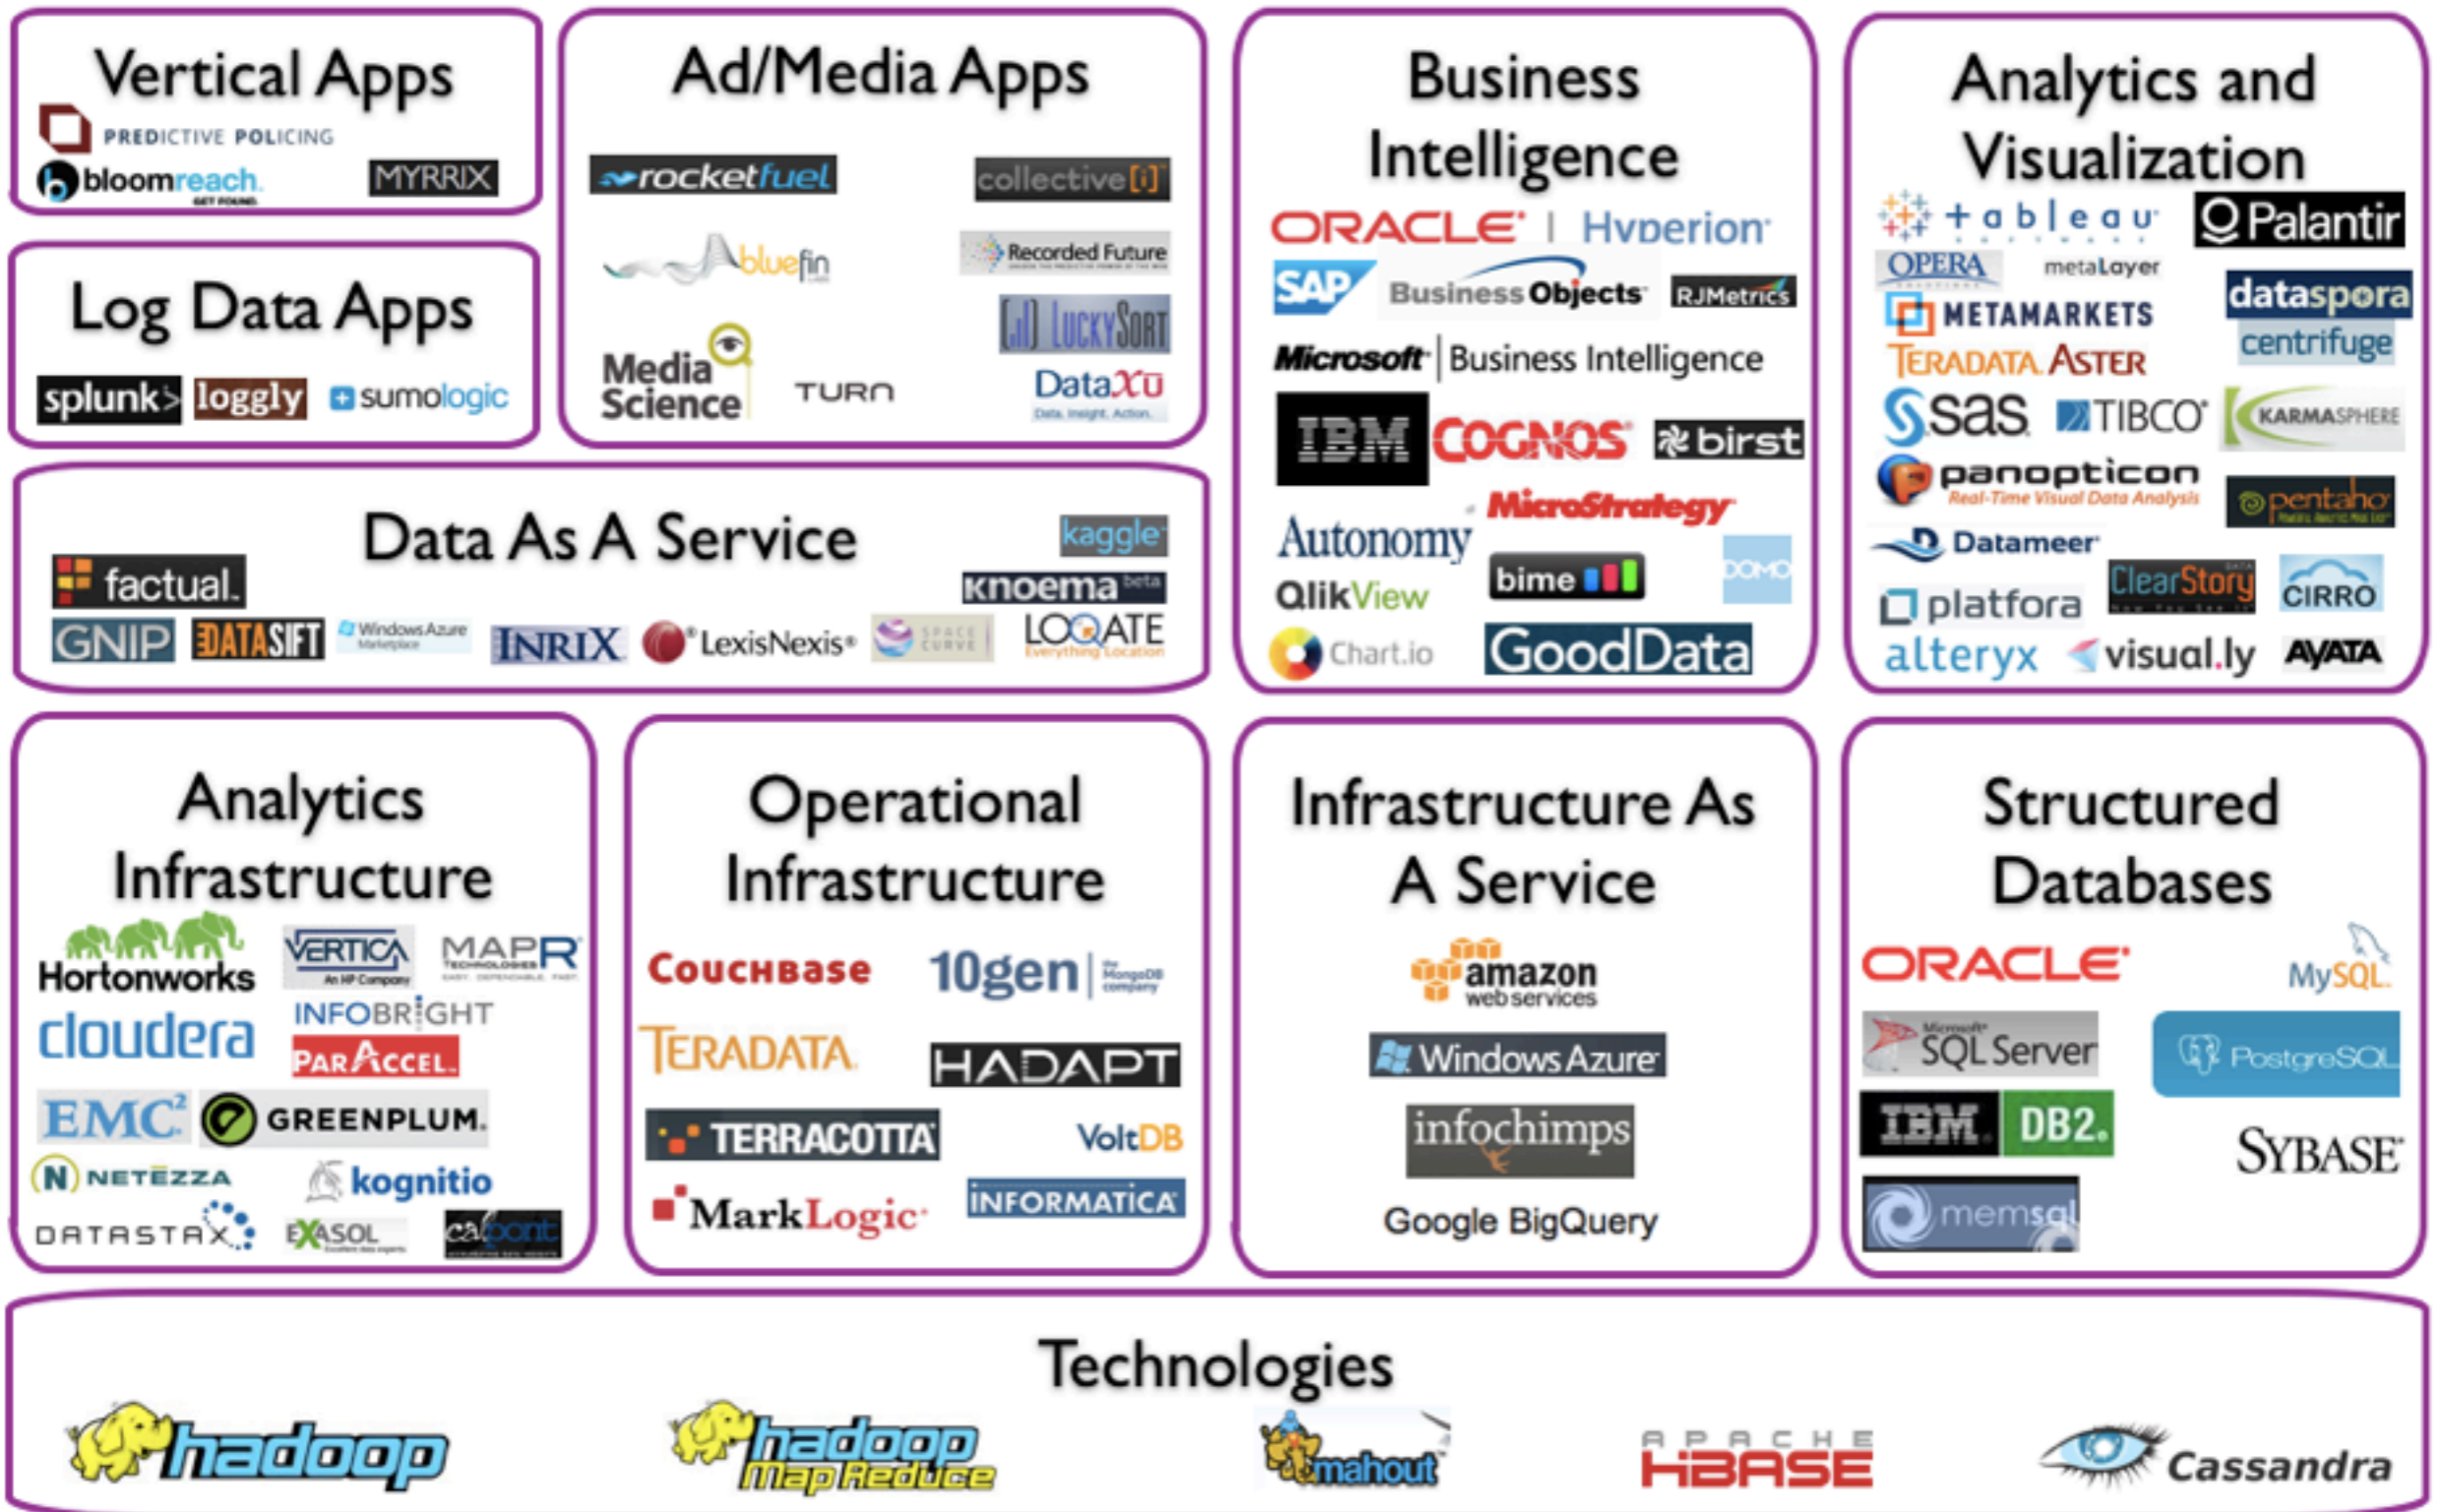

potential annual consumer surplus from using personal location data globally

**60%** potential increase in retailers' operating margins possible with big data

# Big Data in Various Fields

- ▶ Healthcare
- ▶ Government
- ▶ Ecommerce
- ▶ Marketing
- ▶ Manufacturing
- ▶ Retail

# Big Data Landscape

# Value for Different Fields

**Big data can generate significant financial value across sectors**

## **US health care**

- \$300 billion value per year
- ~0.7 percent annual productivity growth

## **Europe public sector administration**

- €250 billion value per year
- ~0.5 percent annual productivity growth

## **Global personal location data**

- \$100 billion+ revenue for service providers
- Up to \$700 billion value to end users

## **US retail**

- 60+% increase in net margin possible
- 0.5–1.0 percent annual productivity growth

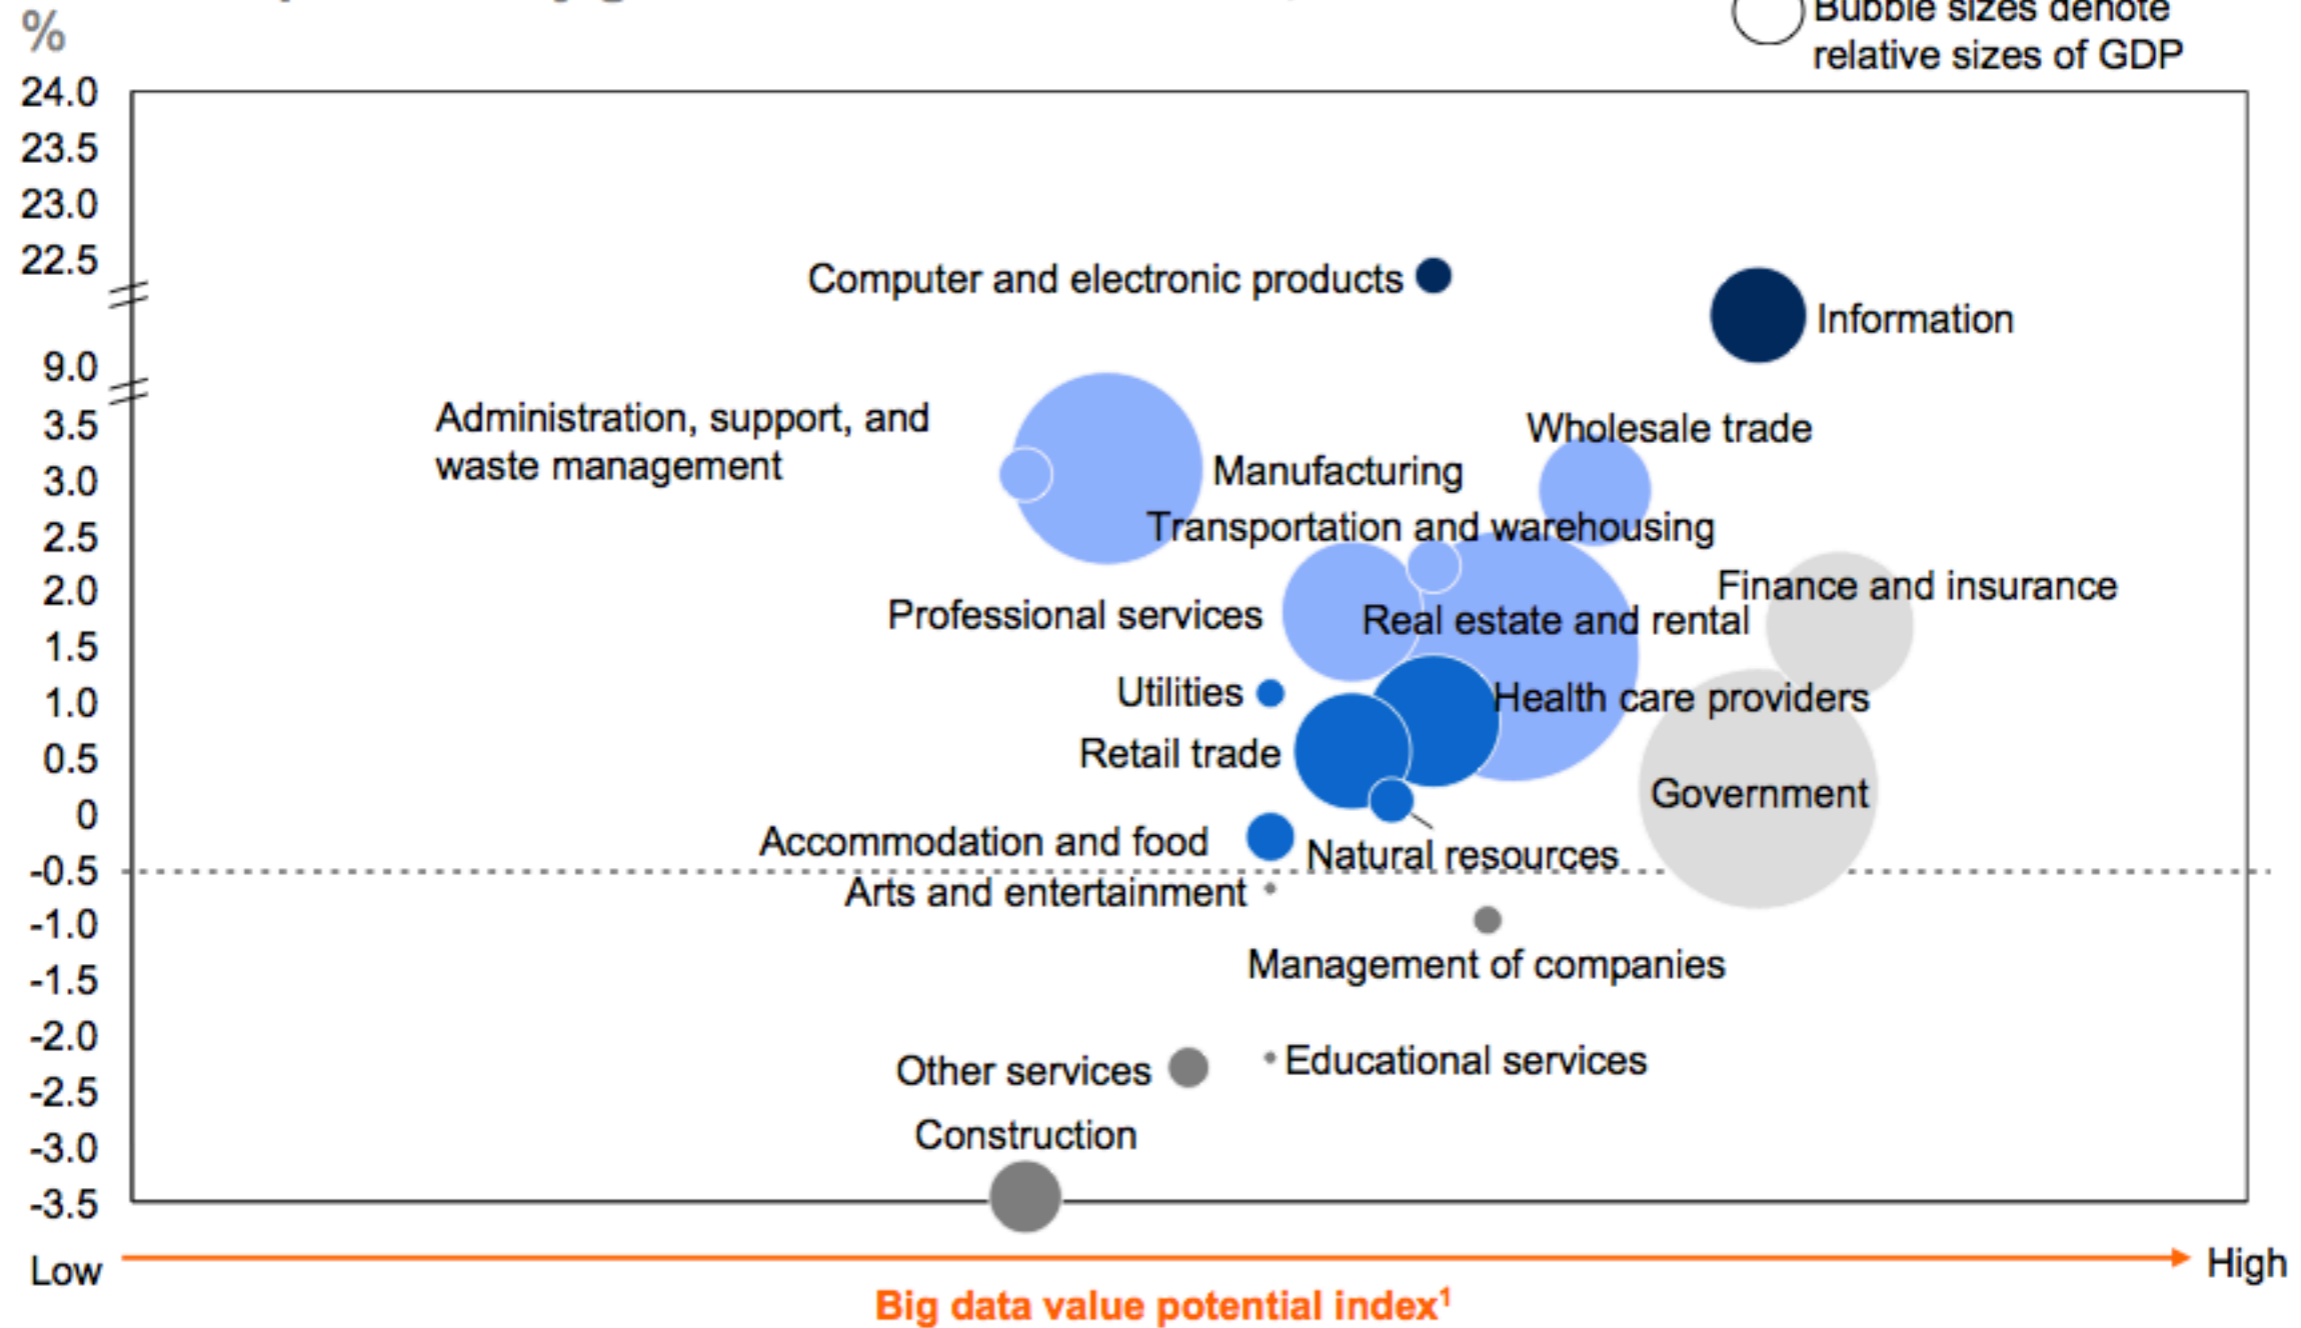

## **Manufacturing**

- Up to 50 percent decrease in product development, assembly costs
- Up to 7 percent reduction in working capital

# Some sectors are positioned for greater gains from the use of big data

Historical productivity growth in the United States, 2000–08

1 See appendix for detailed definitions and metrics used for value potential index.  
 SOURCE: US Bureau of Labor Statistics; McKinsey Global Institute analysis

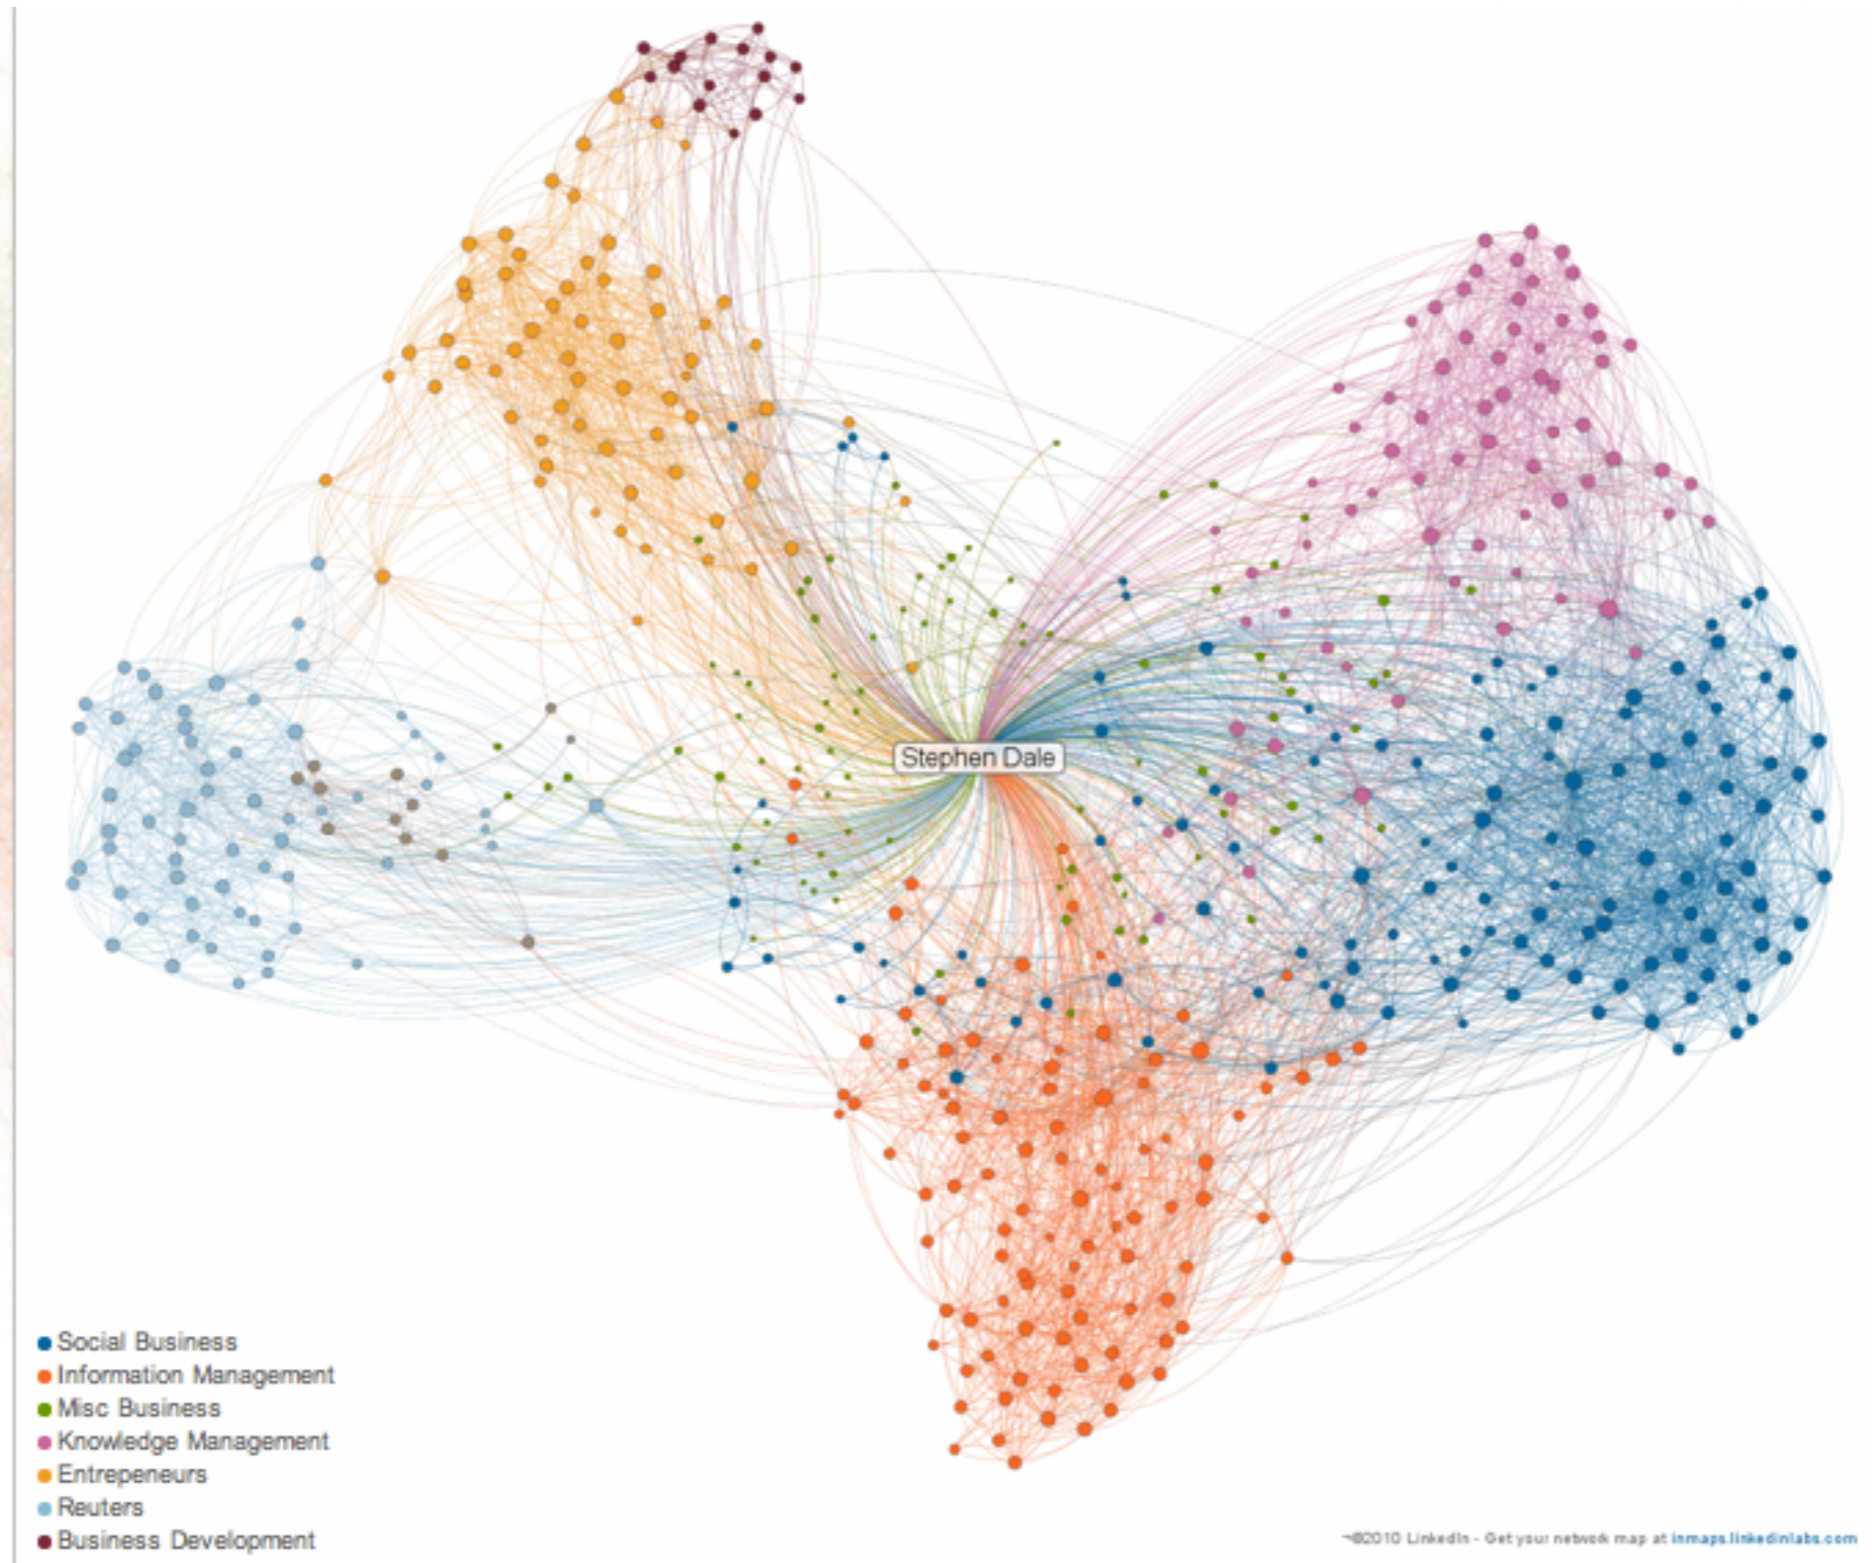

## A heat map shows the relative ease of capturing the value potential across sectors

Categories	Sectors	Overall ease of capture index <sup>1</sup>	Talent	IT intensity	Data-driven mind-set	Data availability
Goods	Manufacturing	Top quintile	Top quintile	4th quintile	3rd quintile	Top quintile

# Generative Classifier

- ▶ We can model class conditional densities using Gaussian distributions
- ▶ If we know class conditional densities
  - ▶  $p(x|y=C1)$
  - ▶  $p(x|y=C2)$
- ▶ We can find a decision to classify the unseen example

# Bayes Rule

$$P(Y|X) = \frac{P(X|Y) P(Y)}{P(X)}$$

C1 = Buys  
C2 = Doesn't Buy

# Generative Classifier

- ▶ Given a new data point find out posterior probability from each class and take a log ratio
- ▶ If higher posterior probability for C1, it means new x better explained by the Gaussian distribution of C1

$$p(y|x) = \frac{p(x|y)p(y)}{p(x)}$$

$$p(y = 1|x) \propto p(x|\mu_1, \Sigma_1)p(y = 1)$$

# Naive Bayes Classifier

- ▶ Naive Bayes Classifier a type of Generative classifier
- ▶ Compute class-conditional distribution but with conditional independence assumption
- ▶ Shown to be very useful for many classification tasks

# Naive Bayes Classifier

- ▶ Conditional Independence Assumption

$$P(X_1, X_2, \dots, X_N | Y) = \prod_{i=1}^N P(X_i | Y)$$

# Naive Bayes Classifier

$$P(Y_k, X_1, X_2, \dots, X_N) = P(Y_k) \prod_i P(X_i | Y_k)$$

Prior Probability  
of the Class

Conditional Probability  
of feature given the  
Class

# Naive Bayes Classifier

$$\begin{aligned} P(Y = y_k | X_1, X_2, \dots, X_N) &= \frac{P(Y=y_k)P(X_1, X_2, \dots, X_N | Y=y_k)}{\sum_j P(Y=y_j)P(X_1, X_2, \dots, X_N | Y=y_j)} \\ &= \frac{P(Y=y_k)\prod_i P(X_i | Y=y_k)}{\sum_j P(Y=y_j)\prod_i P(X_i | Y=y_j)} \end{aligned}$$

$$Y \leftarrow \operatorname{argmax}_{y_k} P(Y = y_k)\prod_i P(X_i | Y = y_k)$$

# Naive Bayes Classifier for Text

- Given the training data what are the parameters to be estimated?

$$P(Y)$$

Diabetes : 0.8  
Hepatitis : 0.2

$$P(X|Y_1)$$

the: 0.001  
diabetic : 0.02  
blood : 0.0015  
sugar : 0.02  
weight : 0.018  
...

$$P(X|Y_2)$$

the: 0.001  
diabetic : 0.0001  
water : 0.0118  
fever : 0.01  
weight : 0.008  
...

# Implementing Naive Bayes

$$P(X|Y_1) \quad P(X|Y_1) = \prod_i P(X = x_i | Y = y_1)$$

$$\theta_{i,j,k} \equiv P(X_i = x_{ij} | Y = y_k)$$

the: 0.001  
diabetic : 0.02  
blood : 0.0015  
sugar : 0.02  
weight : 0.018  
...

MLE Estimation of the parameters

$$\begin{aligned} \hat{\theta}_{i,j,k} &= \hat{P}(X_i = x_{ij} | Y = y_k) \\ &= \frac{\#D\{X_i = x_{ij} \wedge Y = y_k\}}{\#D\{Y = y_k\}} \end{aligned}$$

$\#D\{x\}$  = number of elements in the set D that has property x

# Perceptron

- Dimensionality reduction is one way of classification
- We can also try to find they discriminating hyperplane by reducing the total error in training
  - Perceptrons is one such algorithm

# Perceptron - Loss Function

- We want to find a function that would produce least training error

$$R_n(w) = \frac{1}{n} \sum_{i=1}^n \text{Loss}(y_i, f(x_i; w))$$

# Training Perceptron

Given training data  $\langle (x_i, y_i) \rangle$

We want to find  $w$  such that

$(w \cdot x_i) > 0$  if  $y_i = -1$  misclassified

$(w \cdot x_i) < 0$  if  $y_i = 1$  is misclassified

- We can iterate over all points and adjust the parameters

$$w \leftarrow w + y_i x_i$$

$$\text{if } y_i \neq f(x_i; w)$$

- Parameters are updated only if the classifier makes a mistake

# Training Perceptron

We are given  $(x_i, y_i)$

Initialize  $w$

Do until converged

    if  $\text{error}(y_i, \text{sign}(w \cdot x_i)) == \text{TRUE}$

$$w \leftarrow w + y_i x_i$$

    end if

End do

If predicted class is wrong, subtract or add that point to weight vector

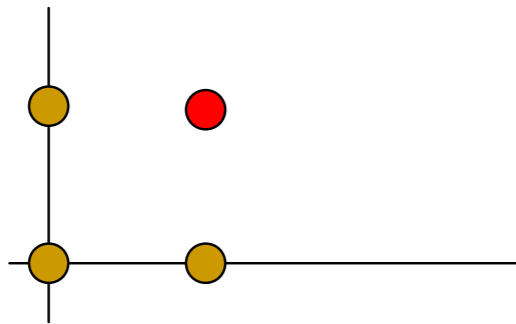

# Training Perceptron

## Another Version

Y is prediction based on weights and it's either 0 or 1 in this case

$$Y_j(t) = f[w(t) \cdot x_j]$$

$$w_i(t + 1) = w_i(t) + \alpha(d_j - y_j(t))x_{i,j}$$

Error is either 1, 0 or -1

Input				Initial weights			Output					Error	Correction	Final weights		
Sensor values			Desired output	$w_0$	$w_1$	$w_2$	Per sensor			Sum	Network	$e$	$d$	Final weights

# 10-fold Cross Validation

- 10 fold cross validation
  - Assuming we have 100K data points
    - Train on 90K (1 to 90,000)
    - Test on 10K (90,001 to 100,000)
  - But we can do this 10 times if we select different 10K of test data point each time

Exp1 

10k	10k	10k	10k	10k	10k	10k	10k	10k	10k	10k
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

Exp2 

10k	10k	10k	10k	10k	10k	10k	10k	10k	10k	10k
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

...

Exp10 

10k	10k	10k	10k	10k	10k	10k	10k	10k	10k	10k
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

- 10 experiments, build model and test times with 10 different sets of training and test data
- Average the accuracy across 10 experiments
- We can do any N-fold cross validation to test our model

# Interpreting Weka Results

	Actual	
Predicted	TP True Positive	FP False Positive
	FN False Negative	TN True Negative

# Precision, Recall, F-Measure

Precision  $TP/(TP+FP)$

Recall  $TP/(TP+FN)$

F-Measure  $\frac{(1+\beta^2) * Precision * Recall}{(\beta^2 * Precision + Recall)}$

Accuracy  $(TP+TN)/(TP+TN+FP+FN)$

# Confusion Matrix

- Assume we are classifying text into two categories Hepatitis (H) and Others (B)
- Let's assume we had 1000 documents such that 500 are H and 500 are B
- Assume we got given predictions

		Actual	
		H	B
Predicted	H	400	200
	B	100	300

Precision	0.6667
Recall	0.8000
F-measure	0.7273
Accuracy	0.7000

# Commandline for Weka

- Make sure CLASSPATH variable is setup; can also give the path explicitly using `-cp` parameter
  - `>> export CLASSPATH=$CLASSPATH:/home/smaskey/soft/weka-3-4-17/weka.jar`
- Try to see if java can access the classes for classifiers
  - `>> java weka.classifiers.bayes.NaiveBayes`
- Try to build a model from commandline
  - `>>java weka.classifiers.trees.J48 -i -t data/weather.arff`
- Try other examples from Weka wiki
  - `>>java weka.classifiers.bayes.NaiveBayes -K -t soybean-train.arff -T soybean-test.arff -p 0`

# Minimum Viable Product Development

- ▶ Build MVP with minimum number of feature sets that allows you to do test your customer
- ▶ All MVPs are not the same
  - ▶ Physical product MVP
  - ▶ Web Application can be tested faster

Goal of MVP is to have a prototype that allows you to figure out if you understand the customer problem and if your product potentially solves it

# Customer Discovery with MVP

**Phase 1** : Set of Hypotheses about your business  
(Problem?, Solution? Value Proposition?)

**Phase 2** : Set of Hypotheses about your business  
(Test your hypotheses by talking to customers)

**Phase 3** : Build MVP and test MVP with customers  
(Does your MVP solves the problem customer want?)

**Phase 4** : Analyze results of your Phase 3  
(Ready to signup paying customers?)

# Multiple MVPs

- ▶ Multiple MVPs can be used to test competing hypotheses
- ▶ Example :
  - ▶ MVP with pay per use model
  - ▶ MVP with pay per month model
- ▶ If it is not difficult to build multiple MVPs then build them and test them with customers
