360° Video Ecosystem

360° cameras

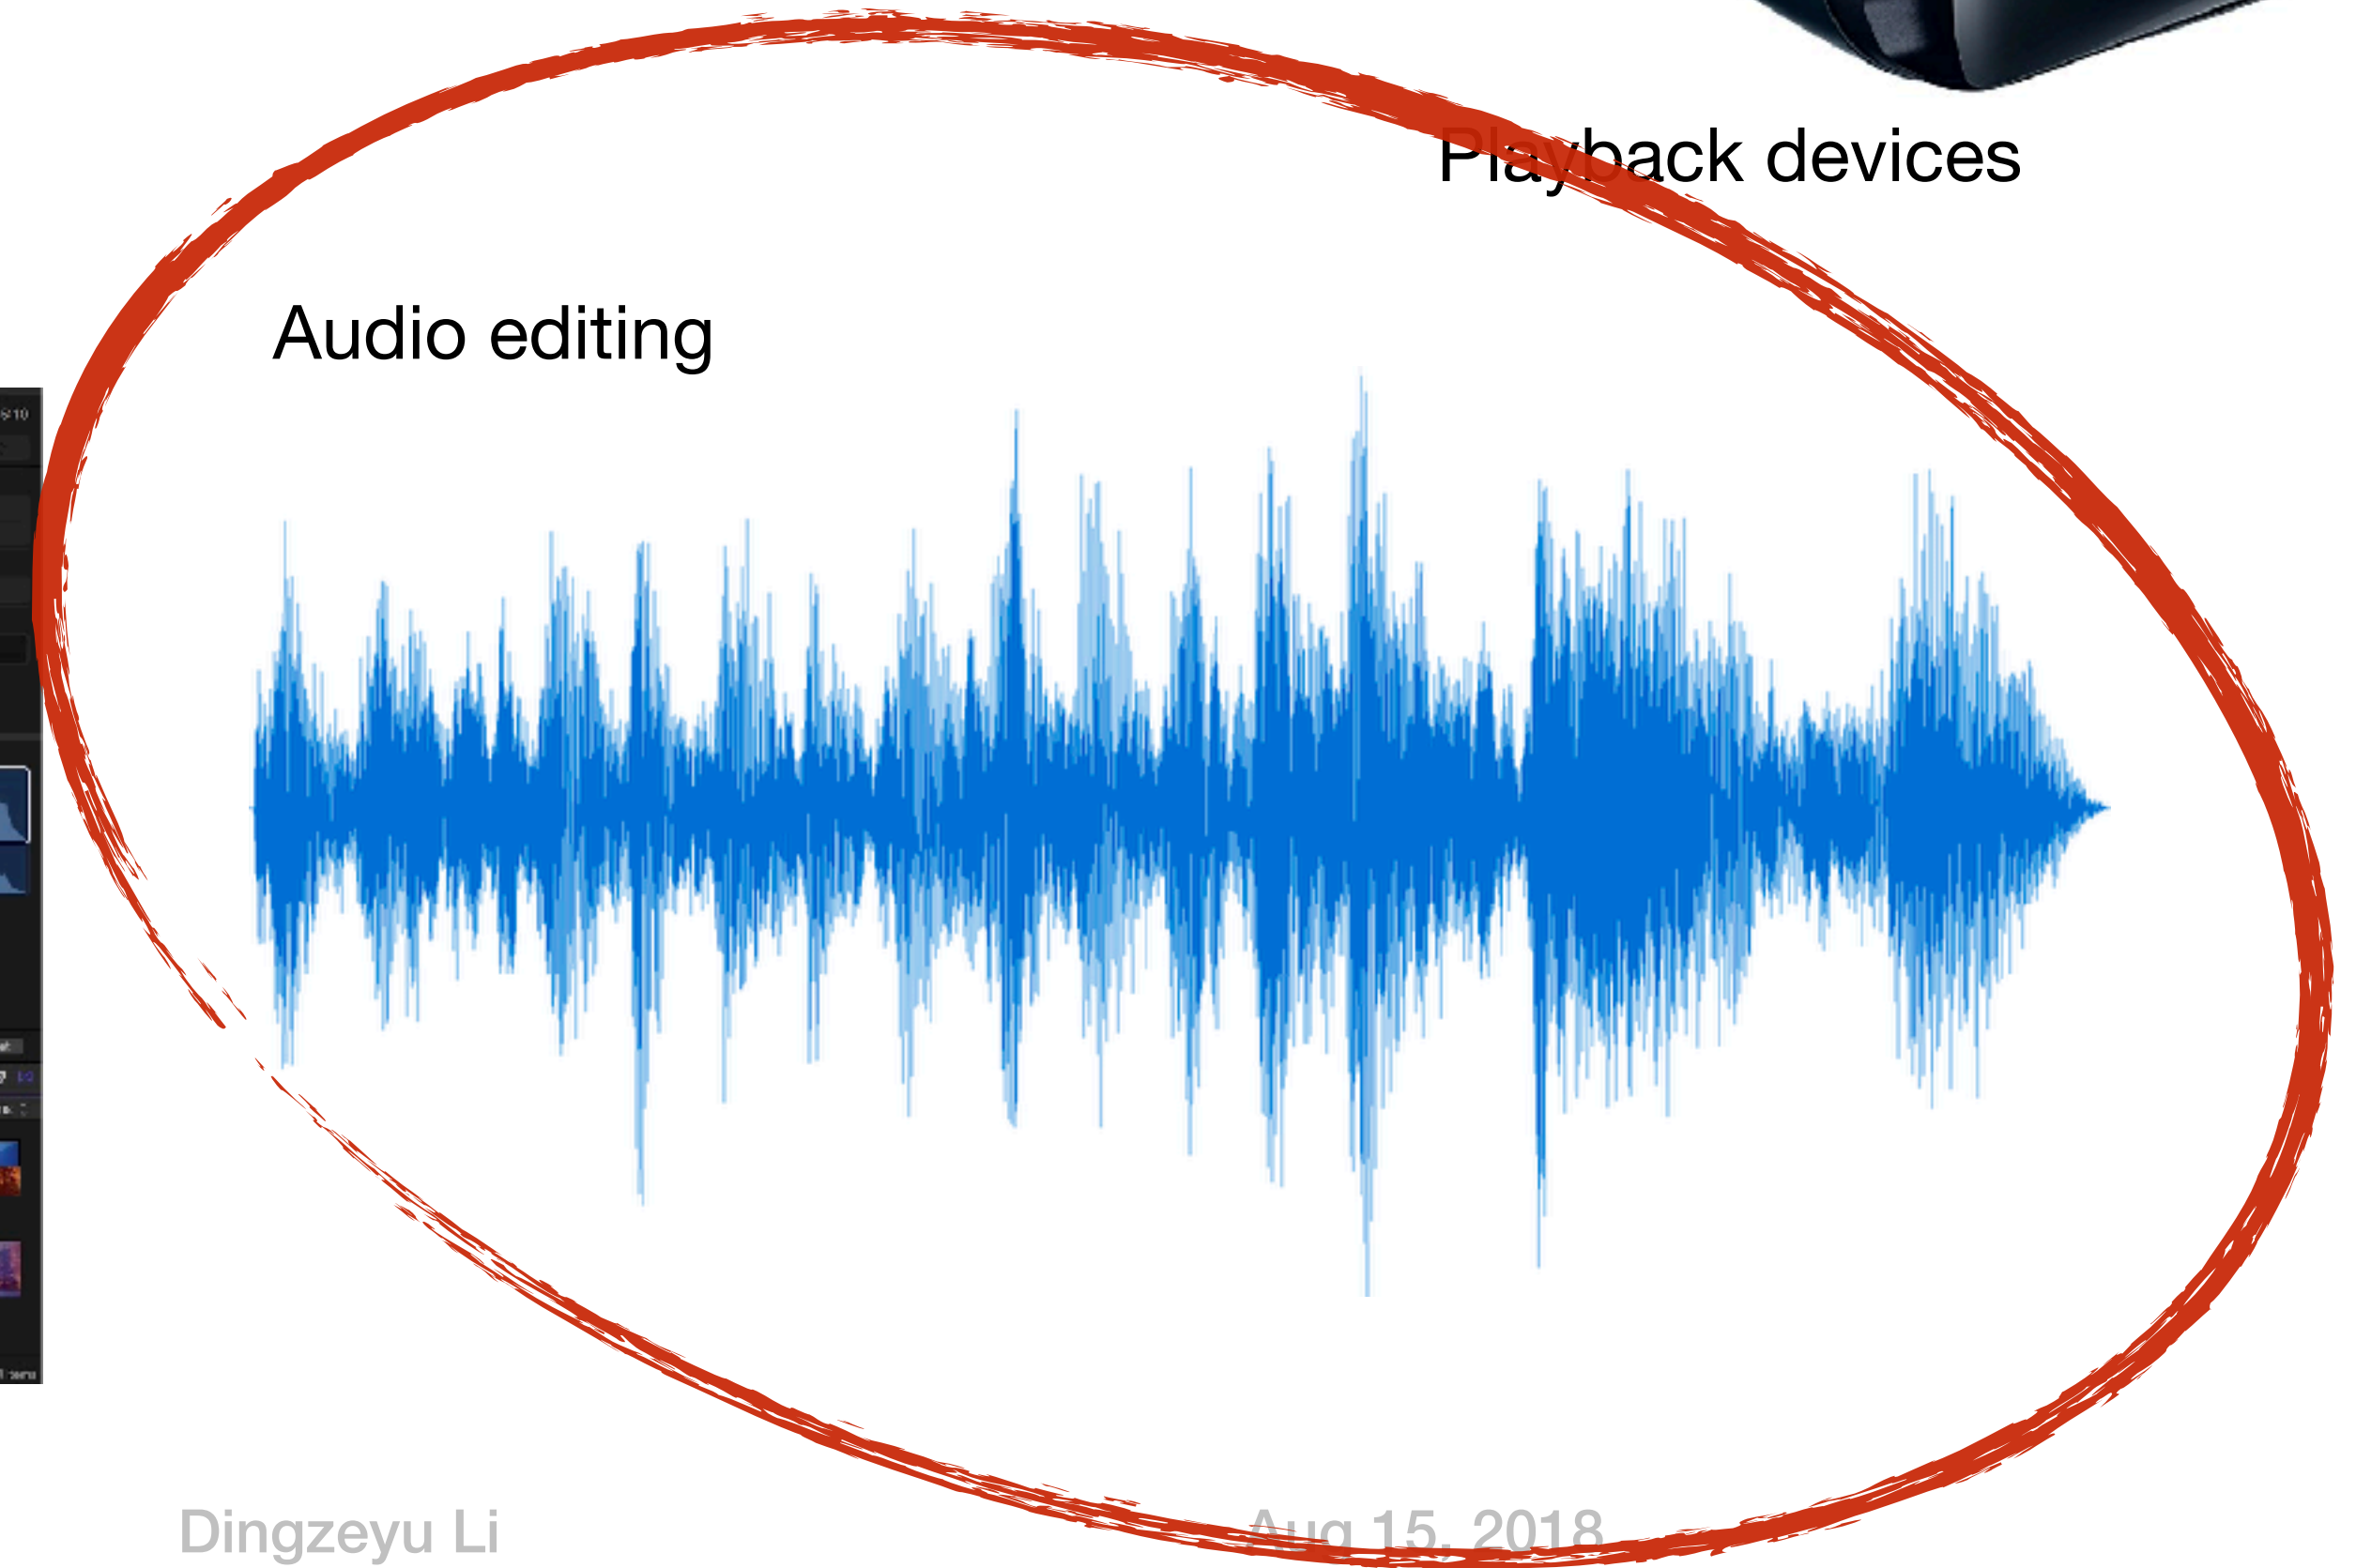

Playback devices

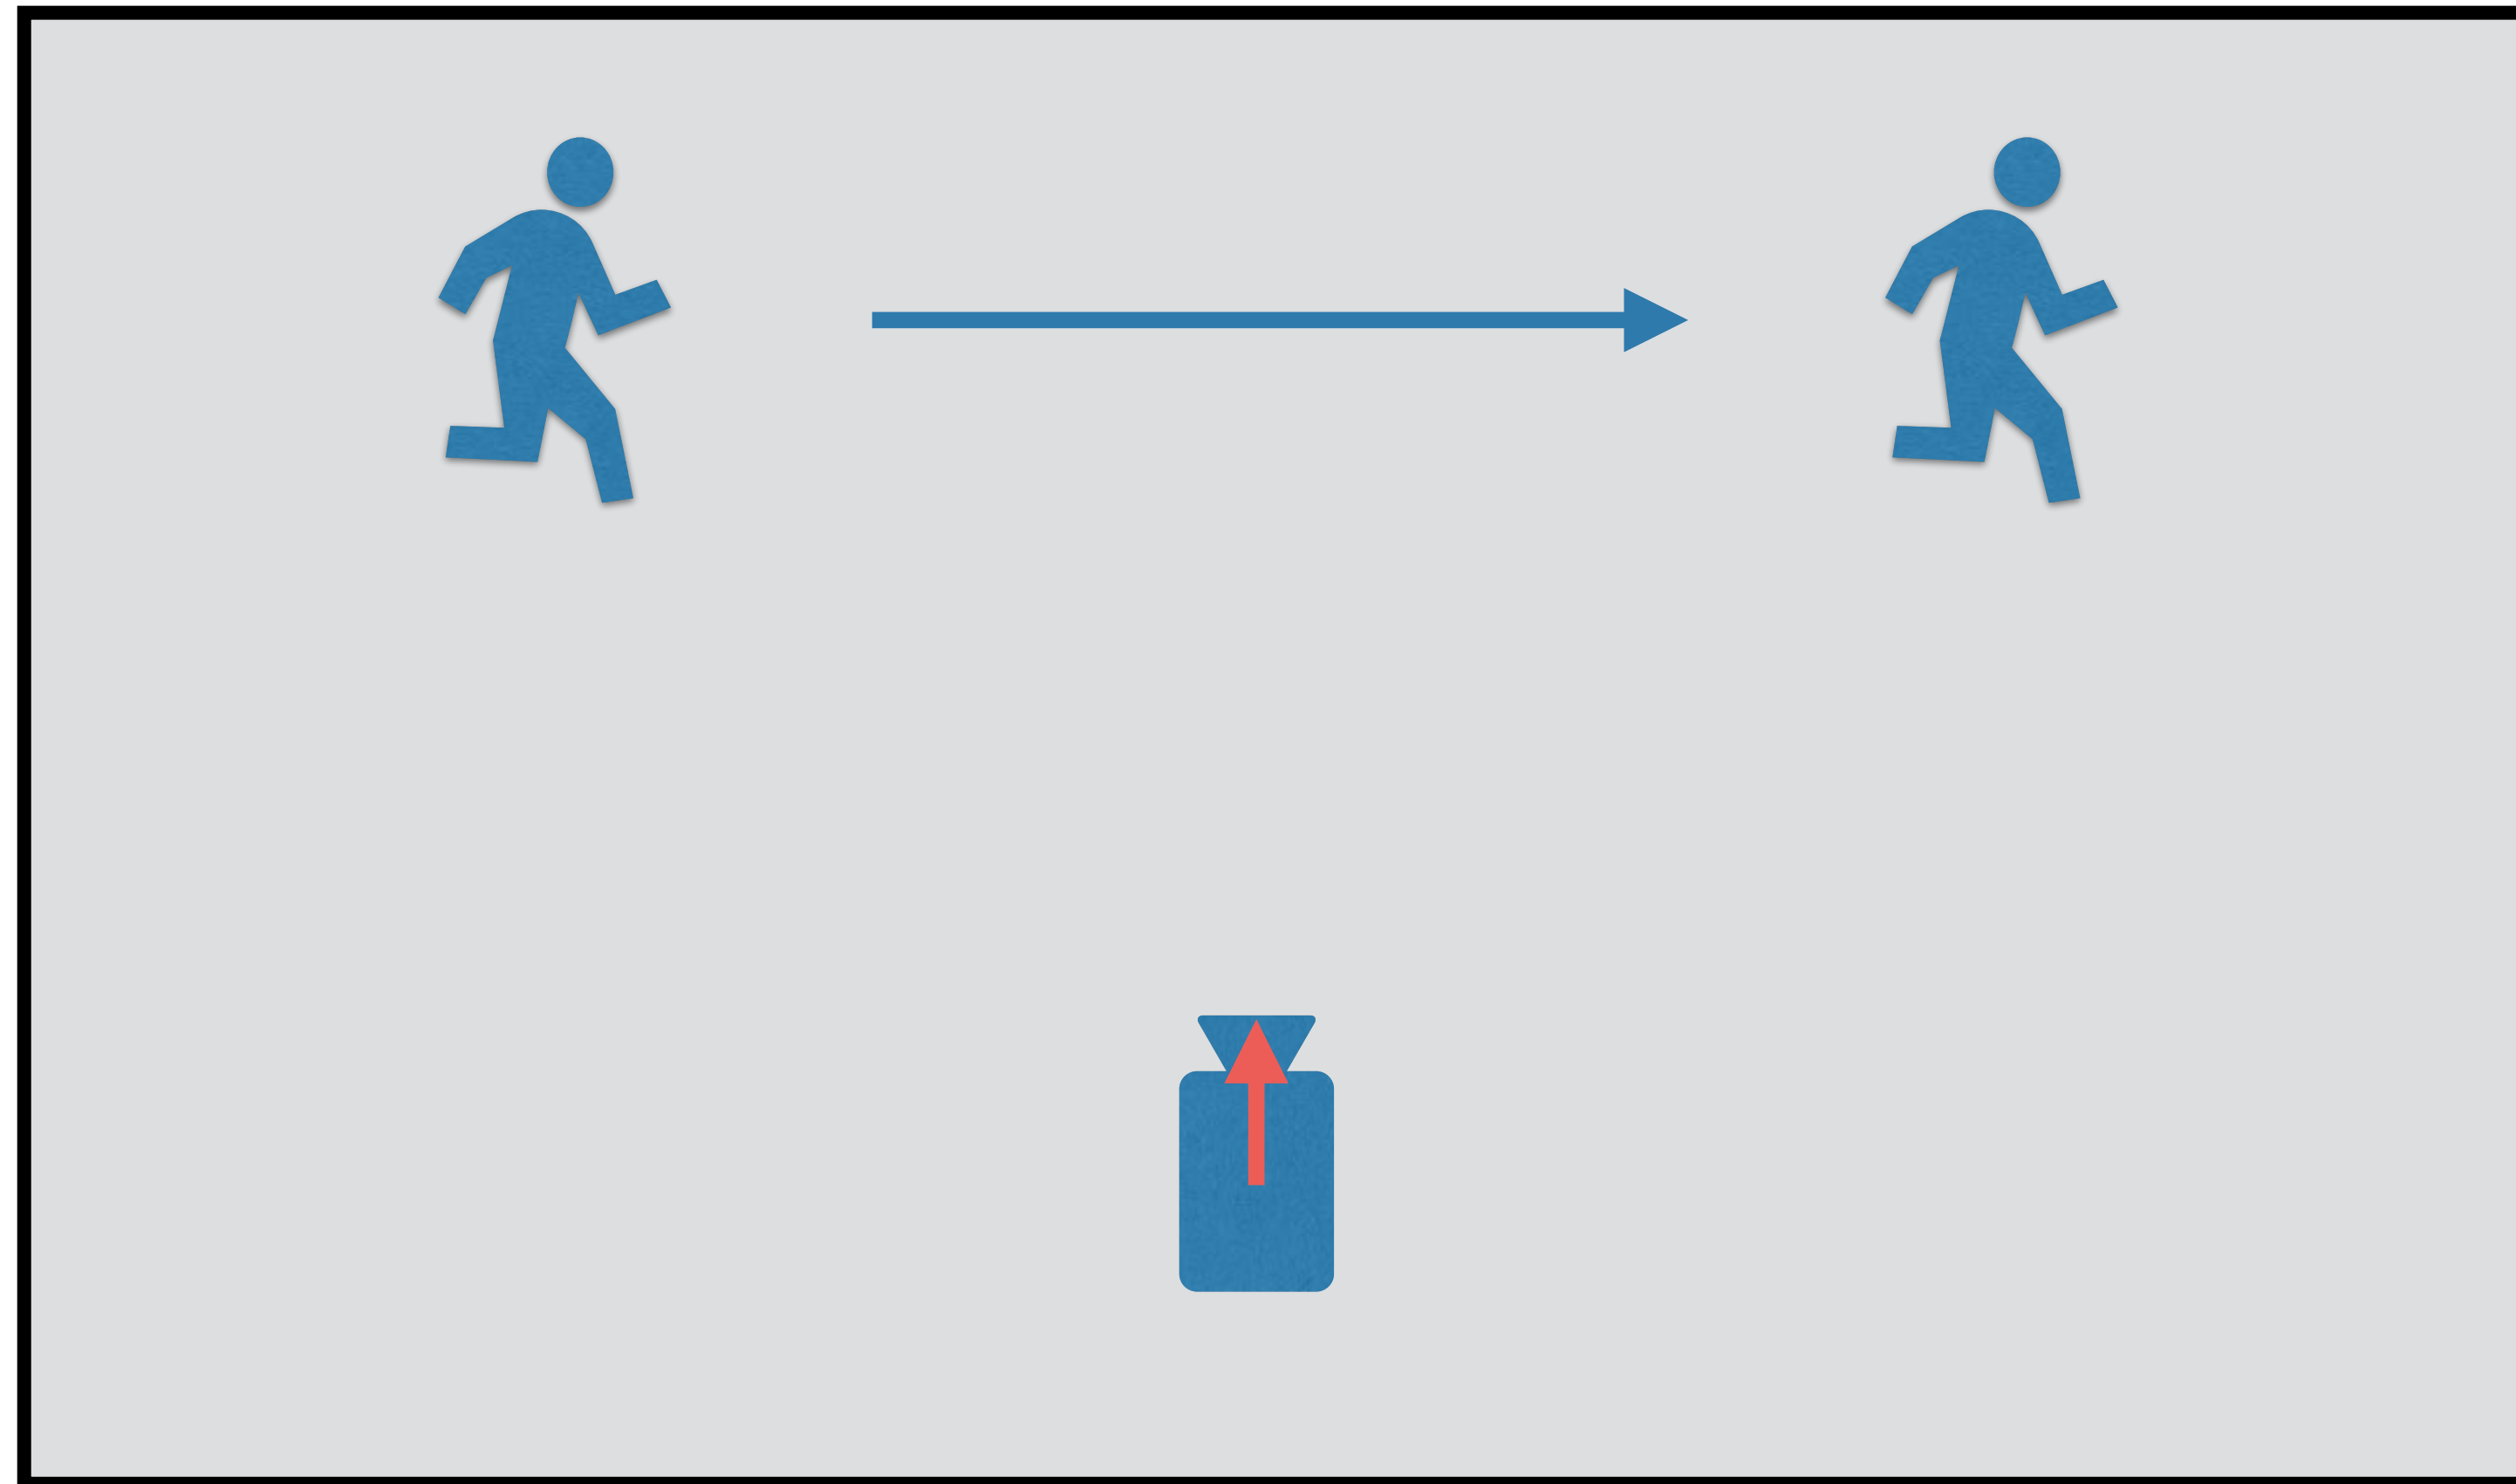

Video editing

Audio editing

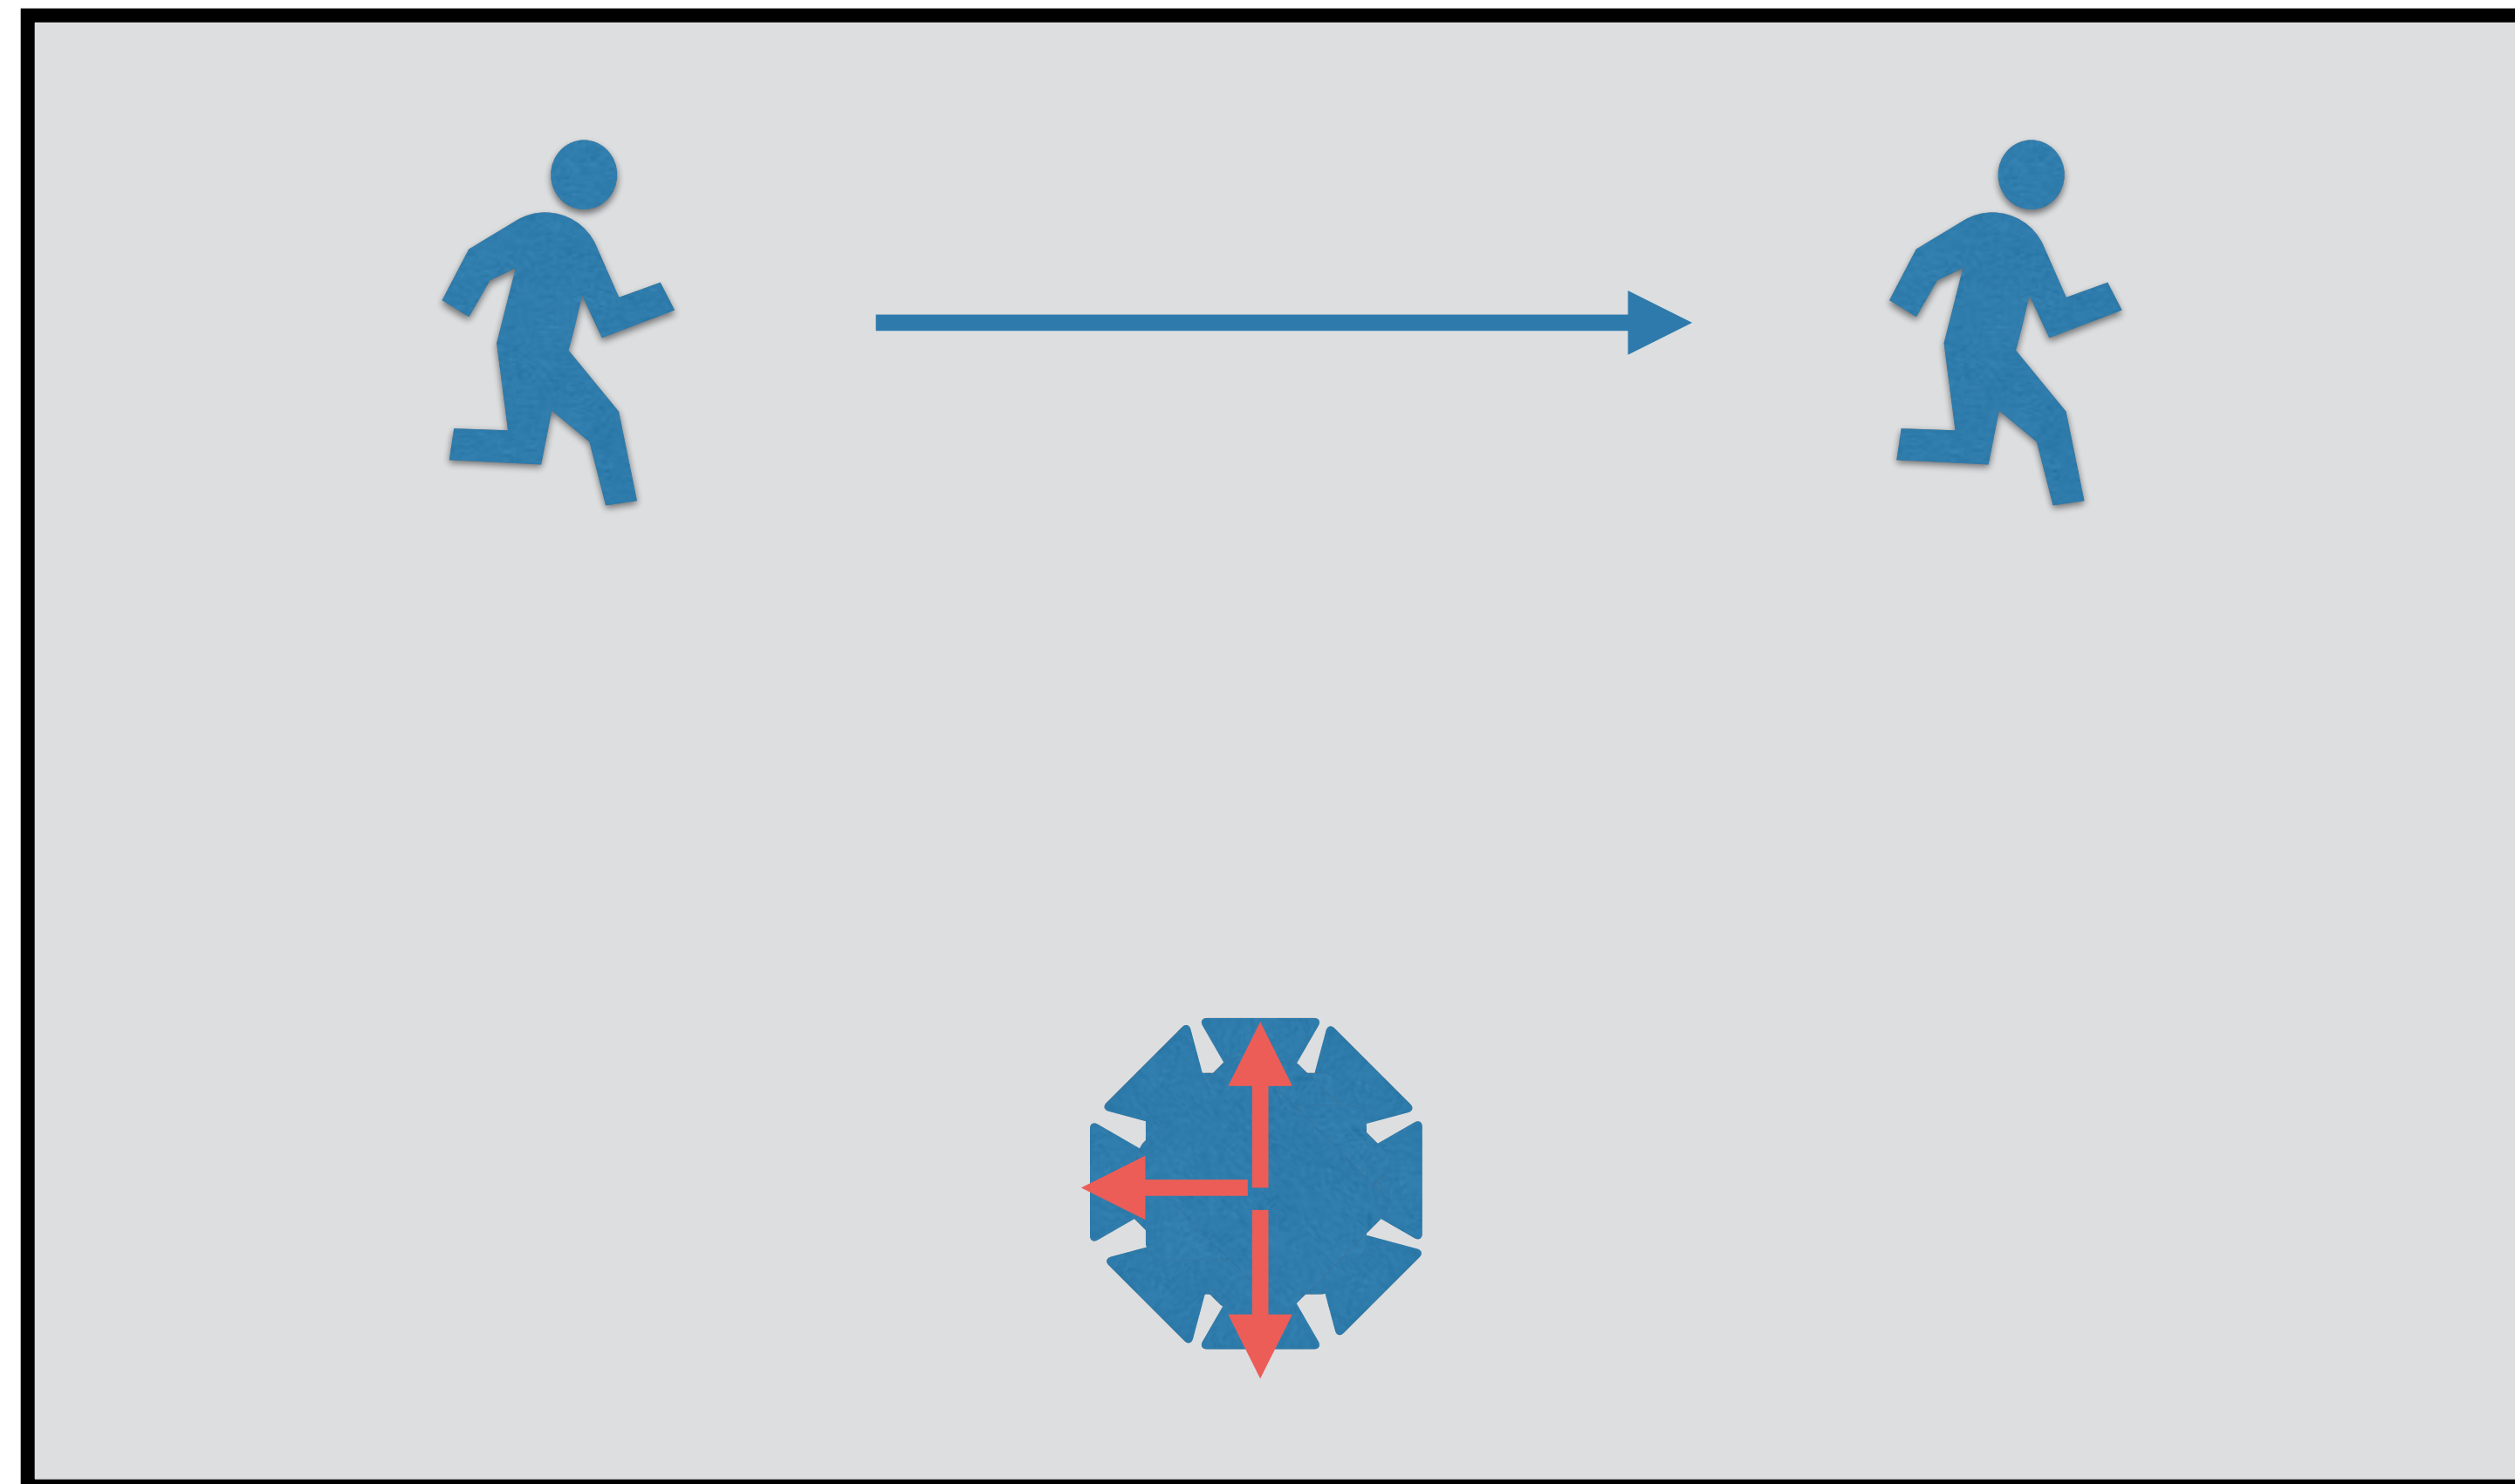

Challenge: Traditional Stereo Audio

fixed viewing direction

Challenge: 360° Spatial Audio

varying viewing direction

Room Acoustics

Impulse Response (IR)

source: rational acoustics

Impulse Response (IR)

source: rational acoustics

early reflections
directionality

late tail
sense of the environment

IR from recording

- easy to setup and obtain
- lack the dynamic directional effects

[Zotkin et al. 2004]

[Tervo et al. 2010]

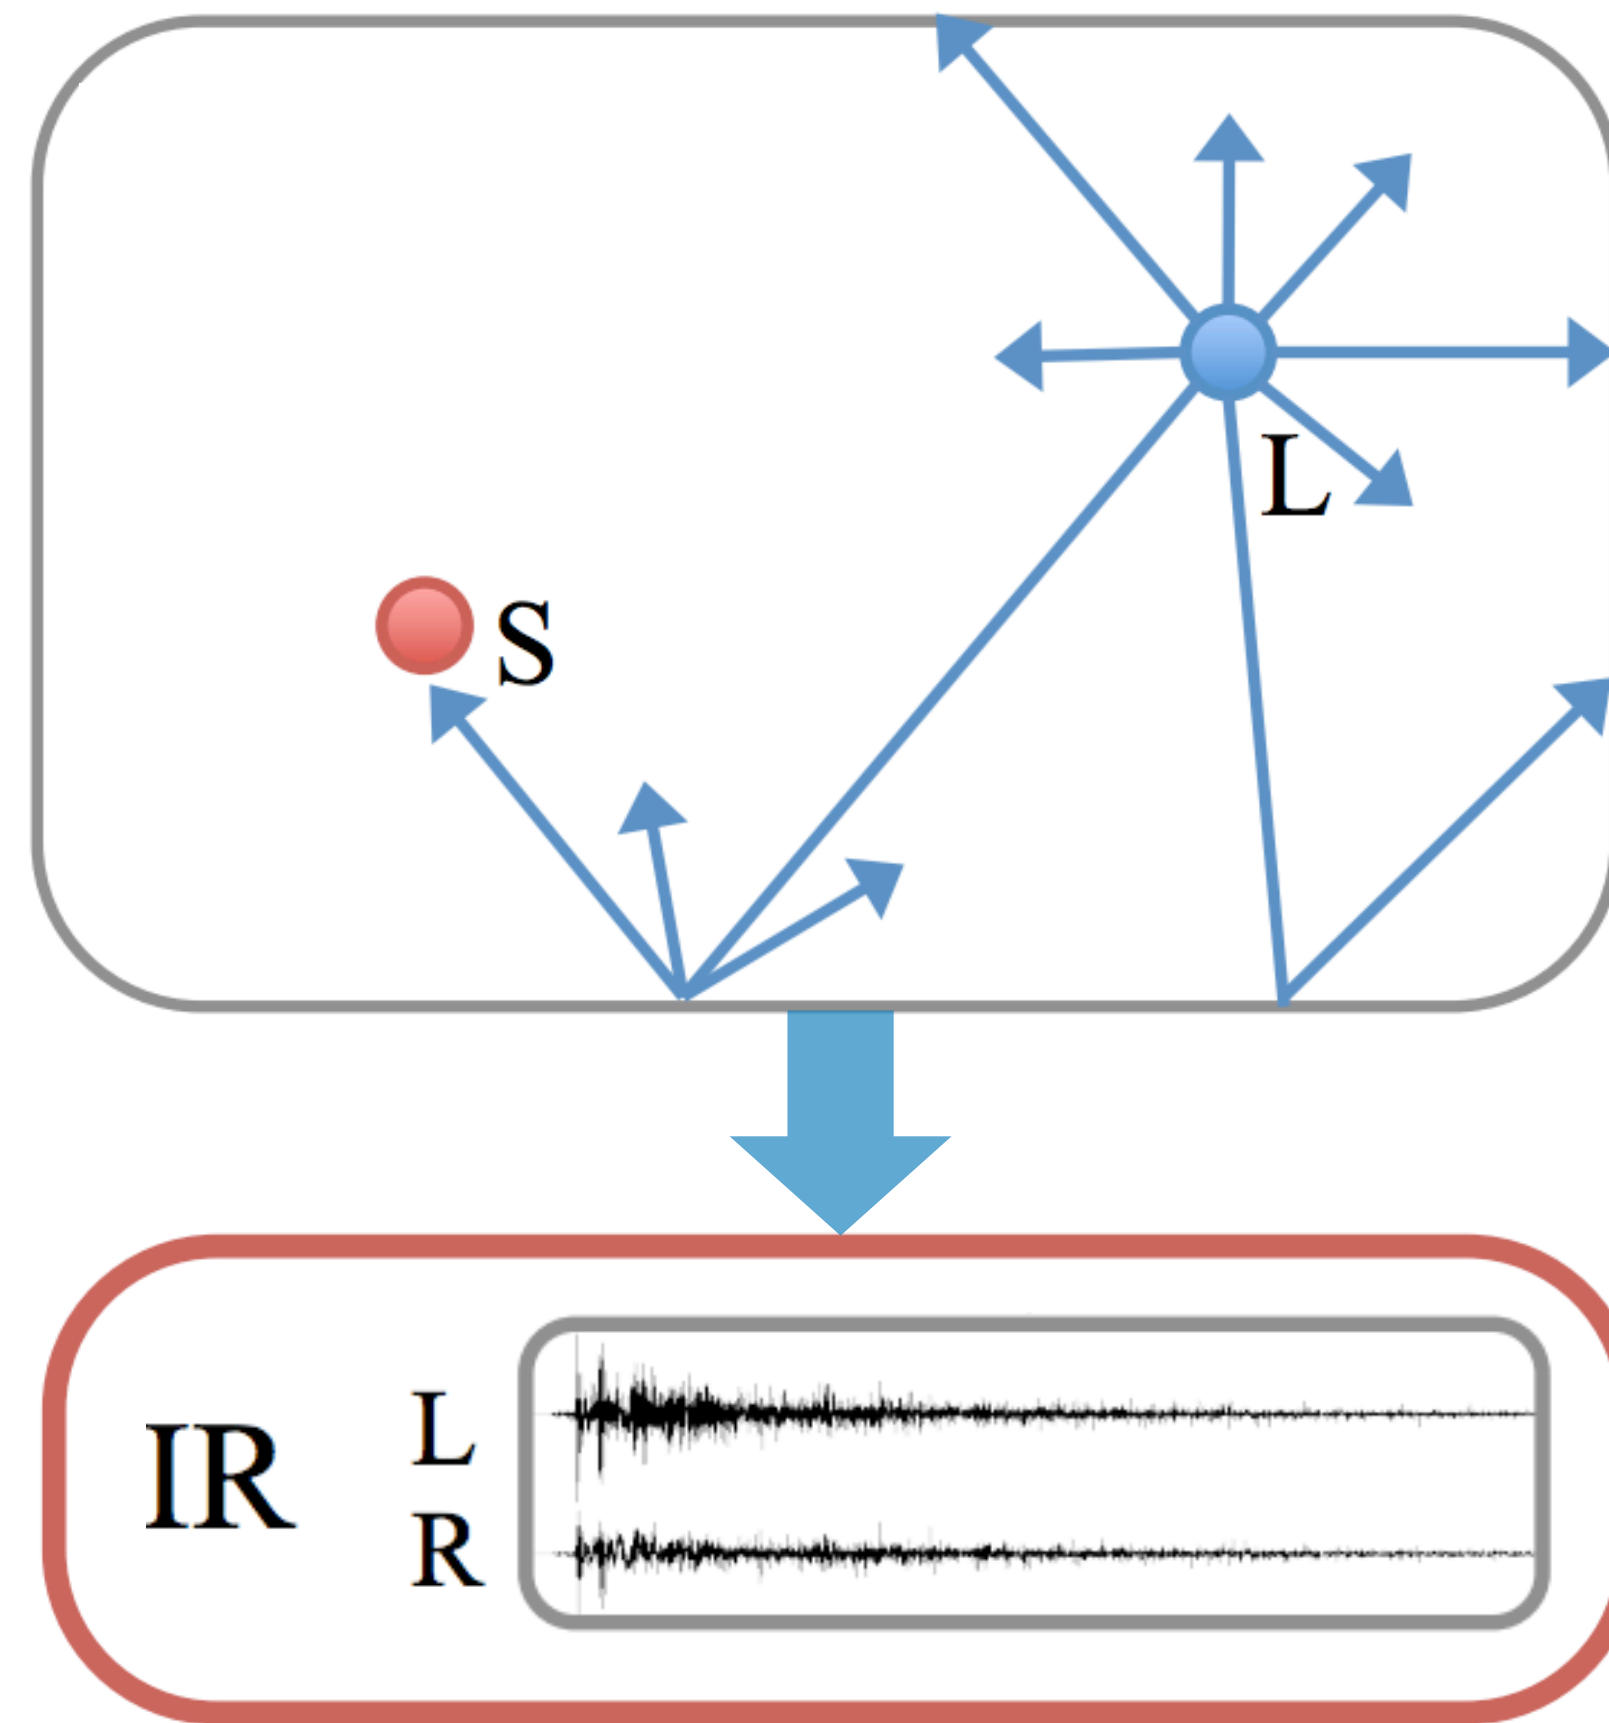

[Traer and McDermott 2016]

IR from Acoustic Simulation

[Raghuvanshi et al. 2009]

wave-based: accurate
slow to simulate

[Schissler et al. 2017]

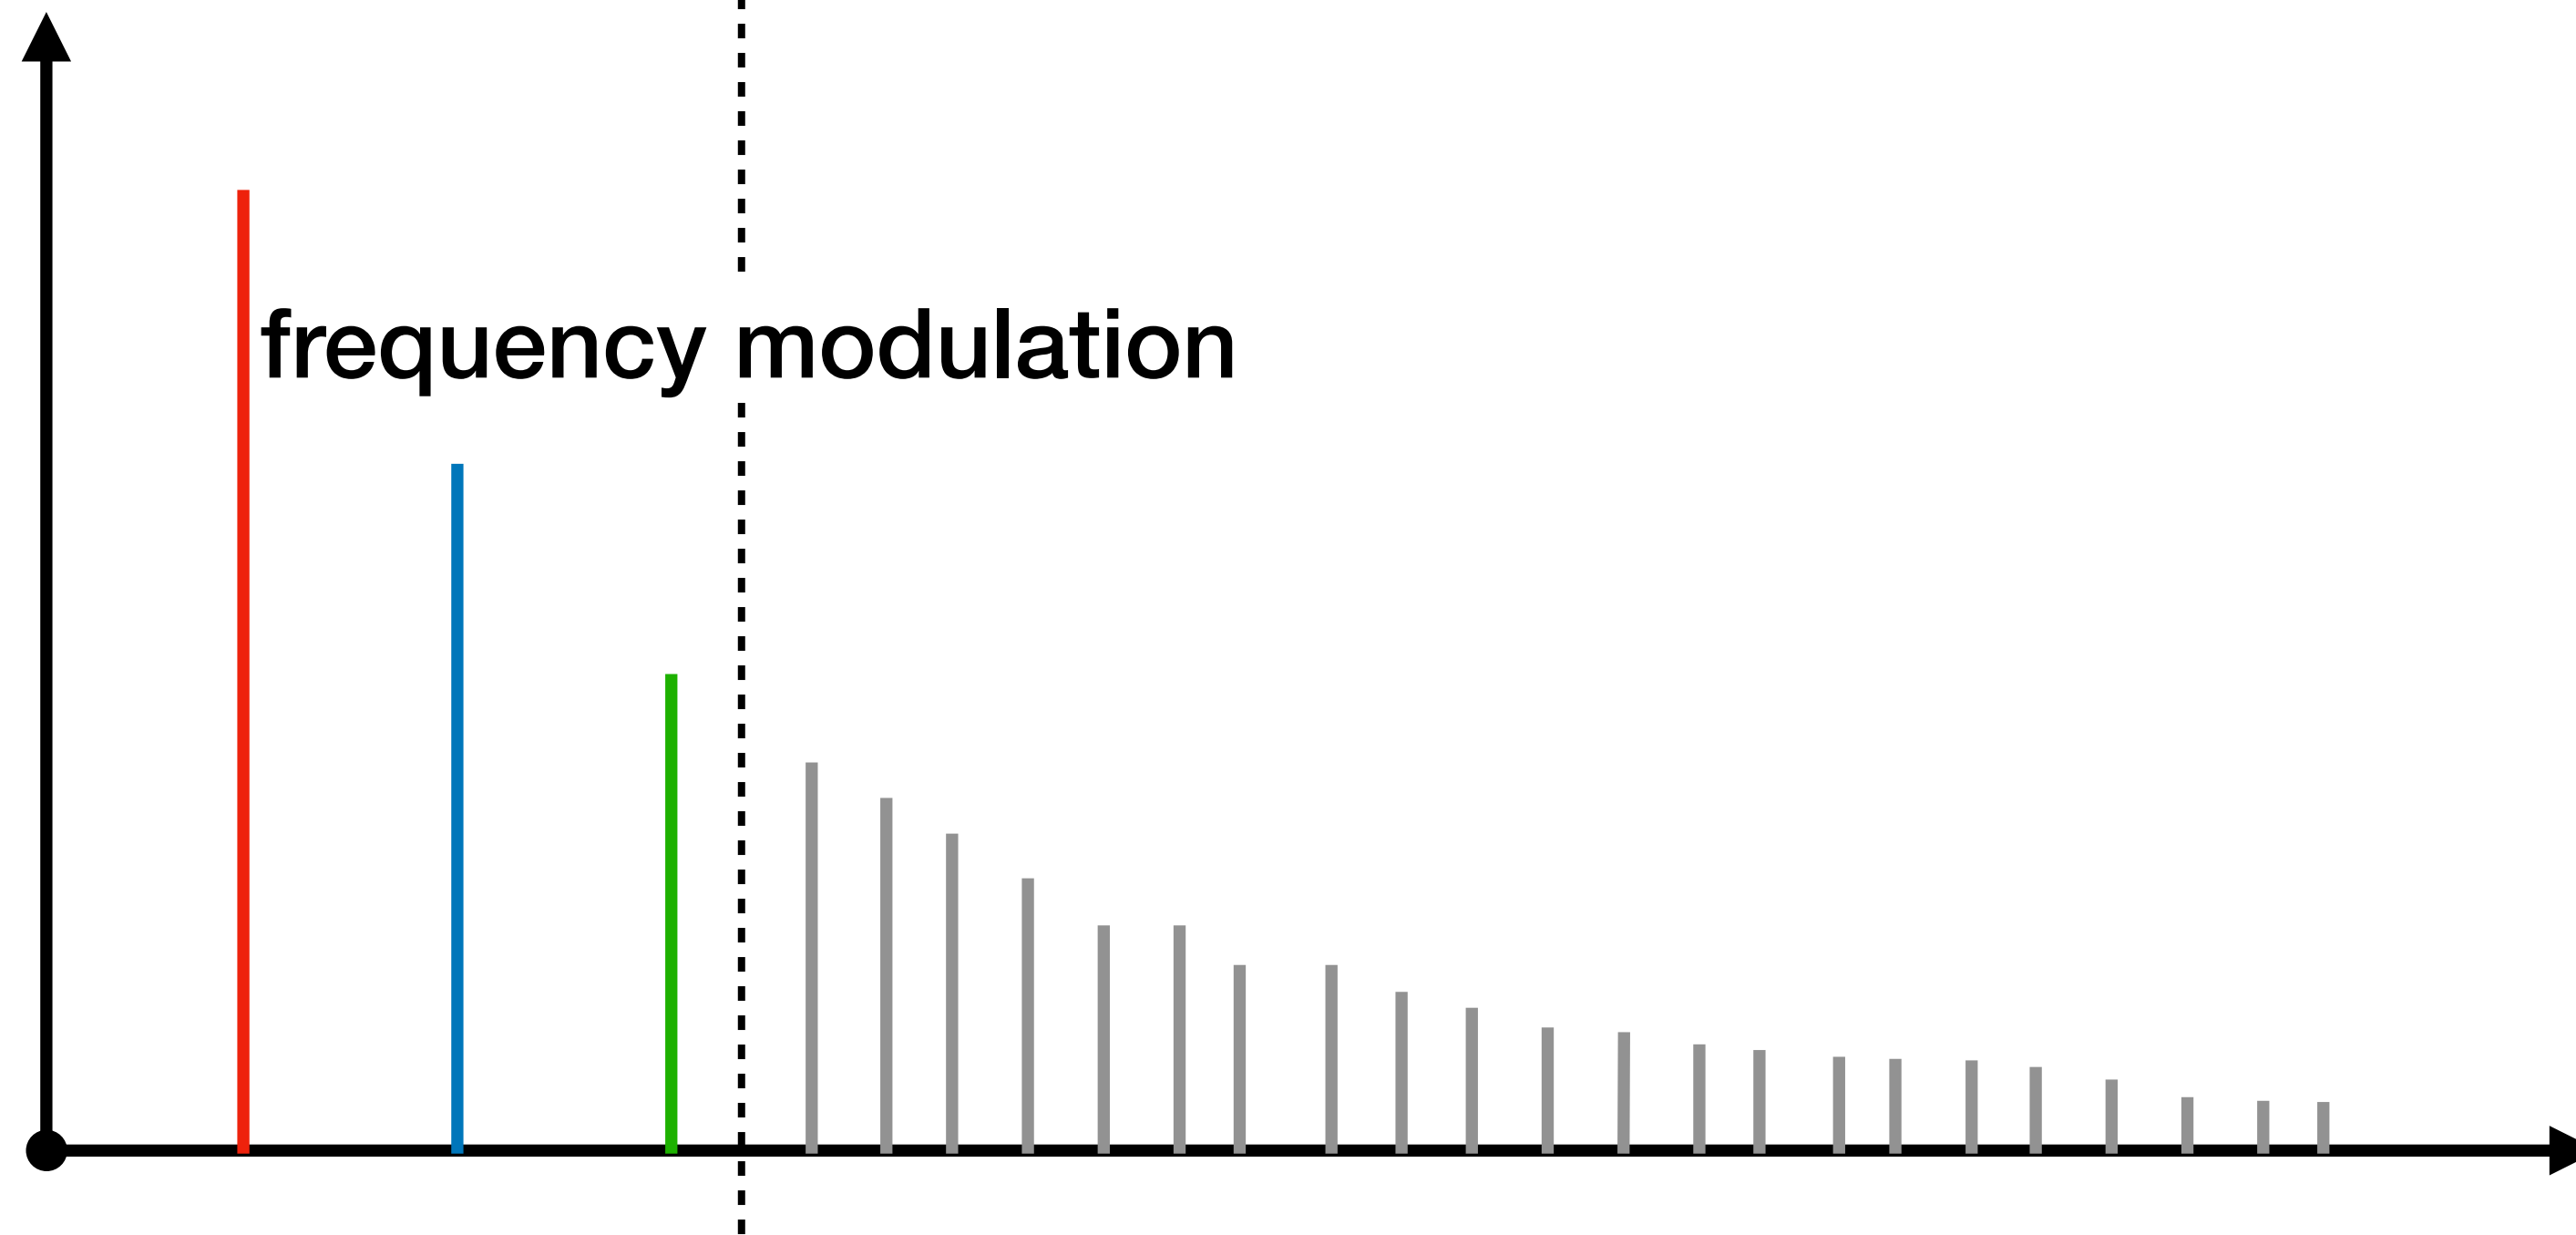

geometric acoustics: fast
lack wave-based behavior

Key Insight: Isotropy in late IR

early reflections
optimized simulation

late tail
hybrid synthesis

frequency modulation

Contributions

room material optimization

frequency modulation

hybrid synthesis

Scene-Aware Spatial Audio Pipeline

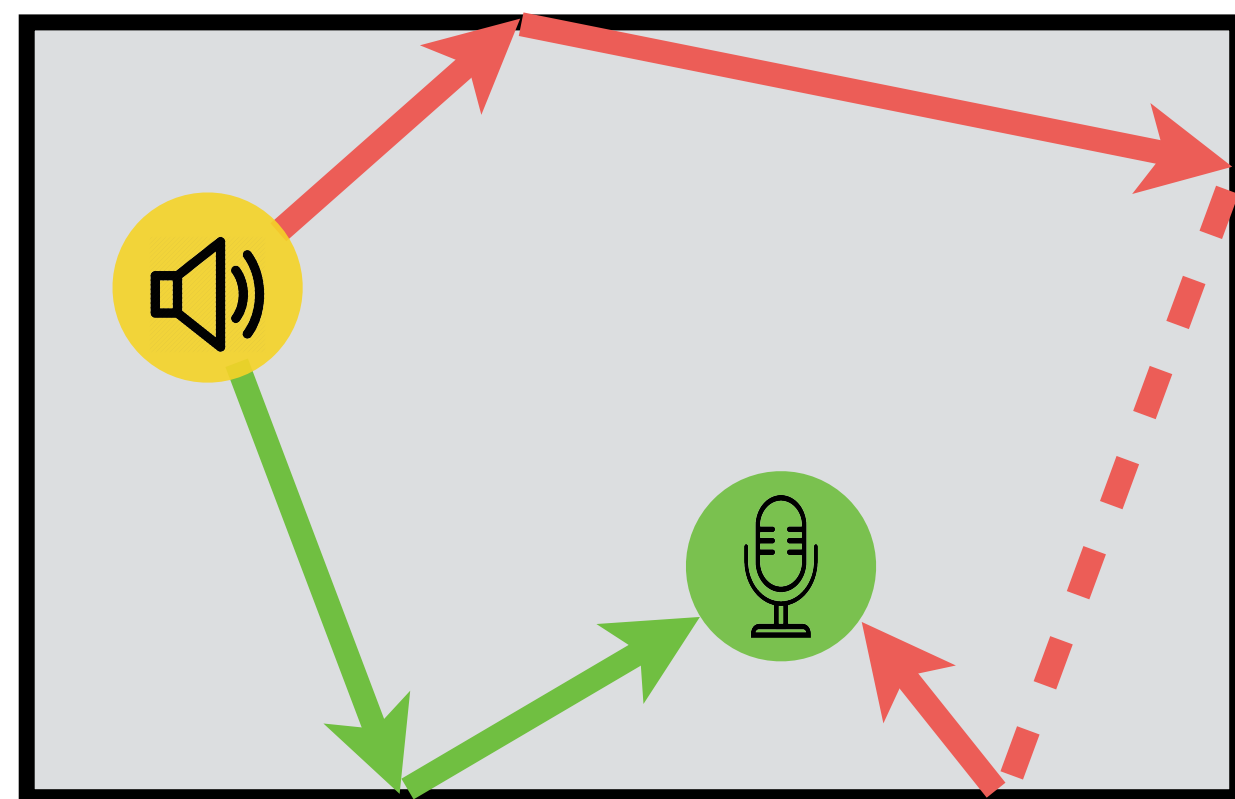

room material optimization

frequency modulation

hybrid synthesis

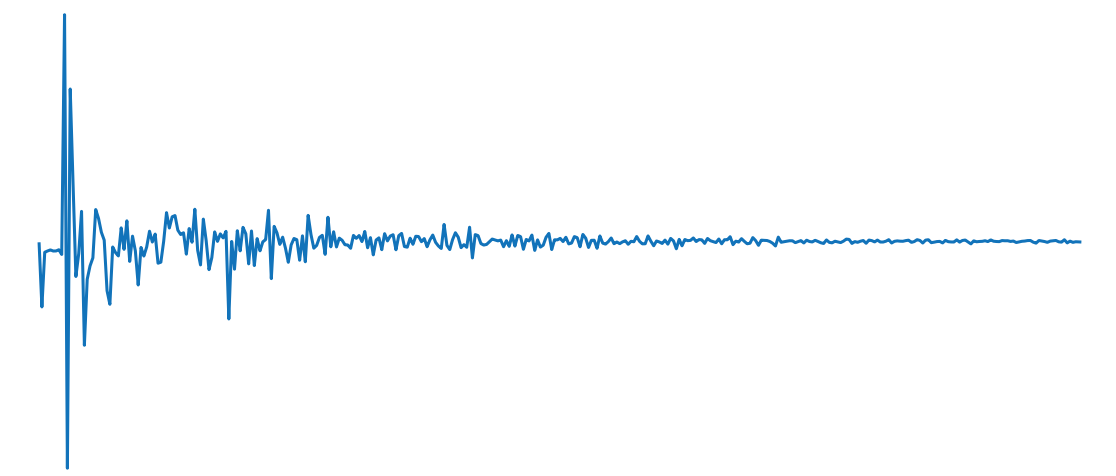

Acoustic Measurement

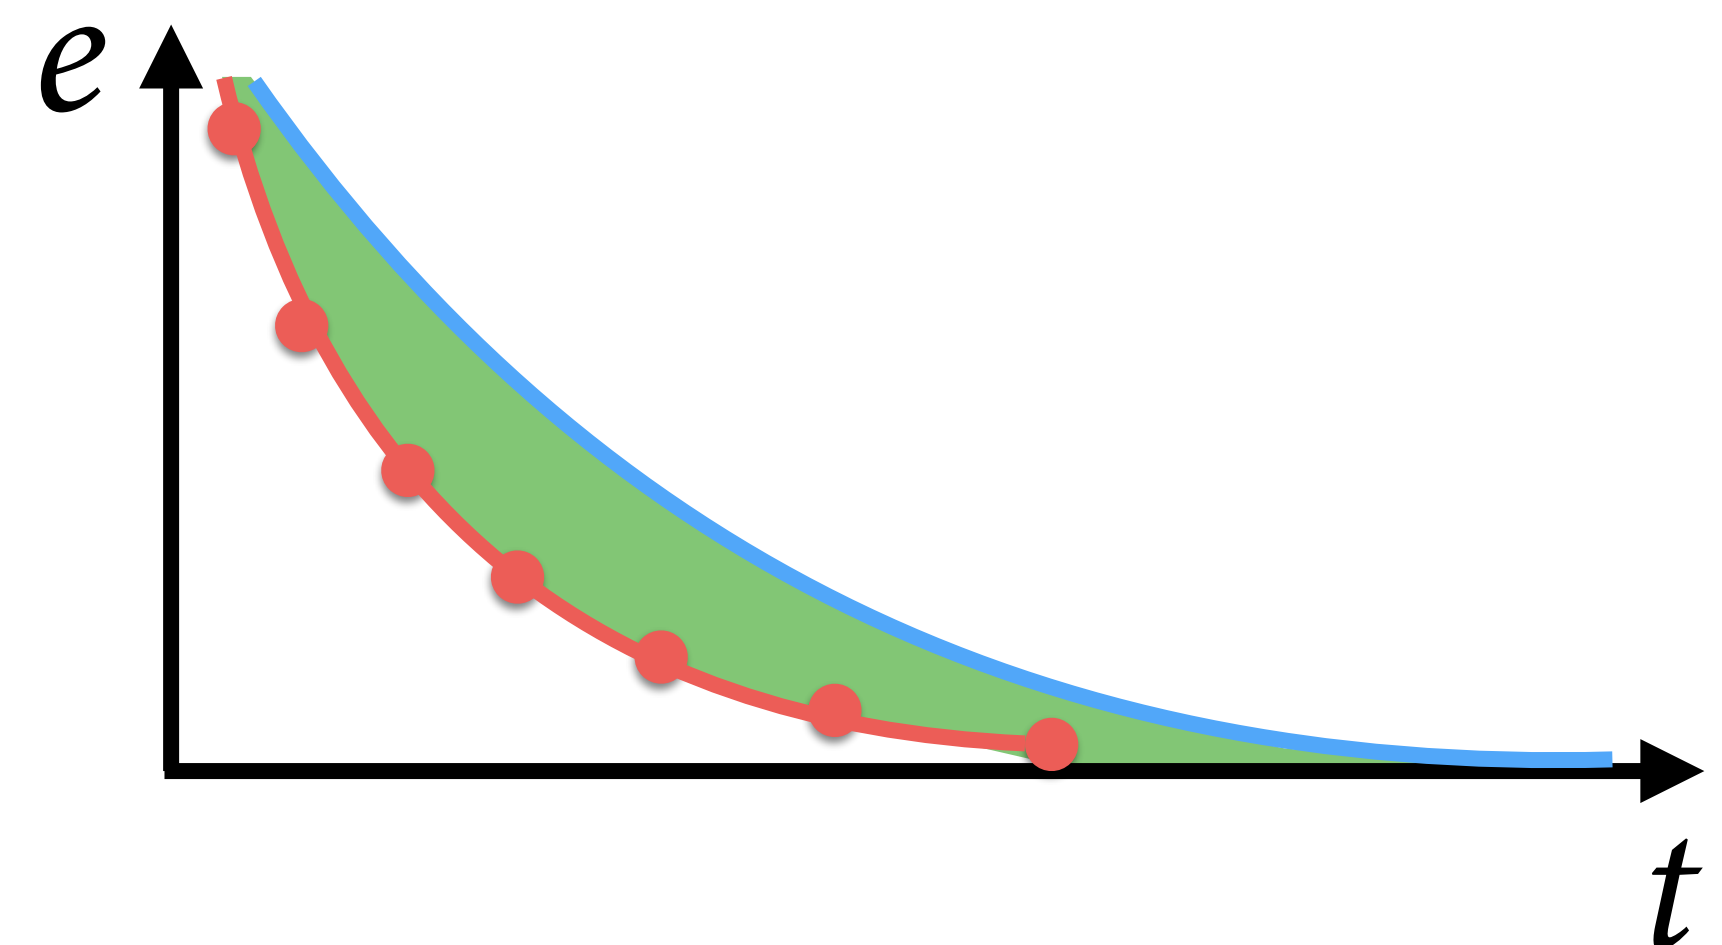

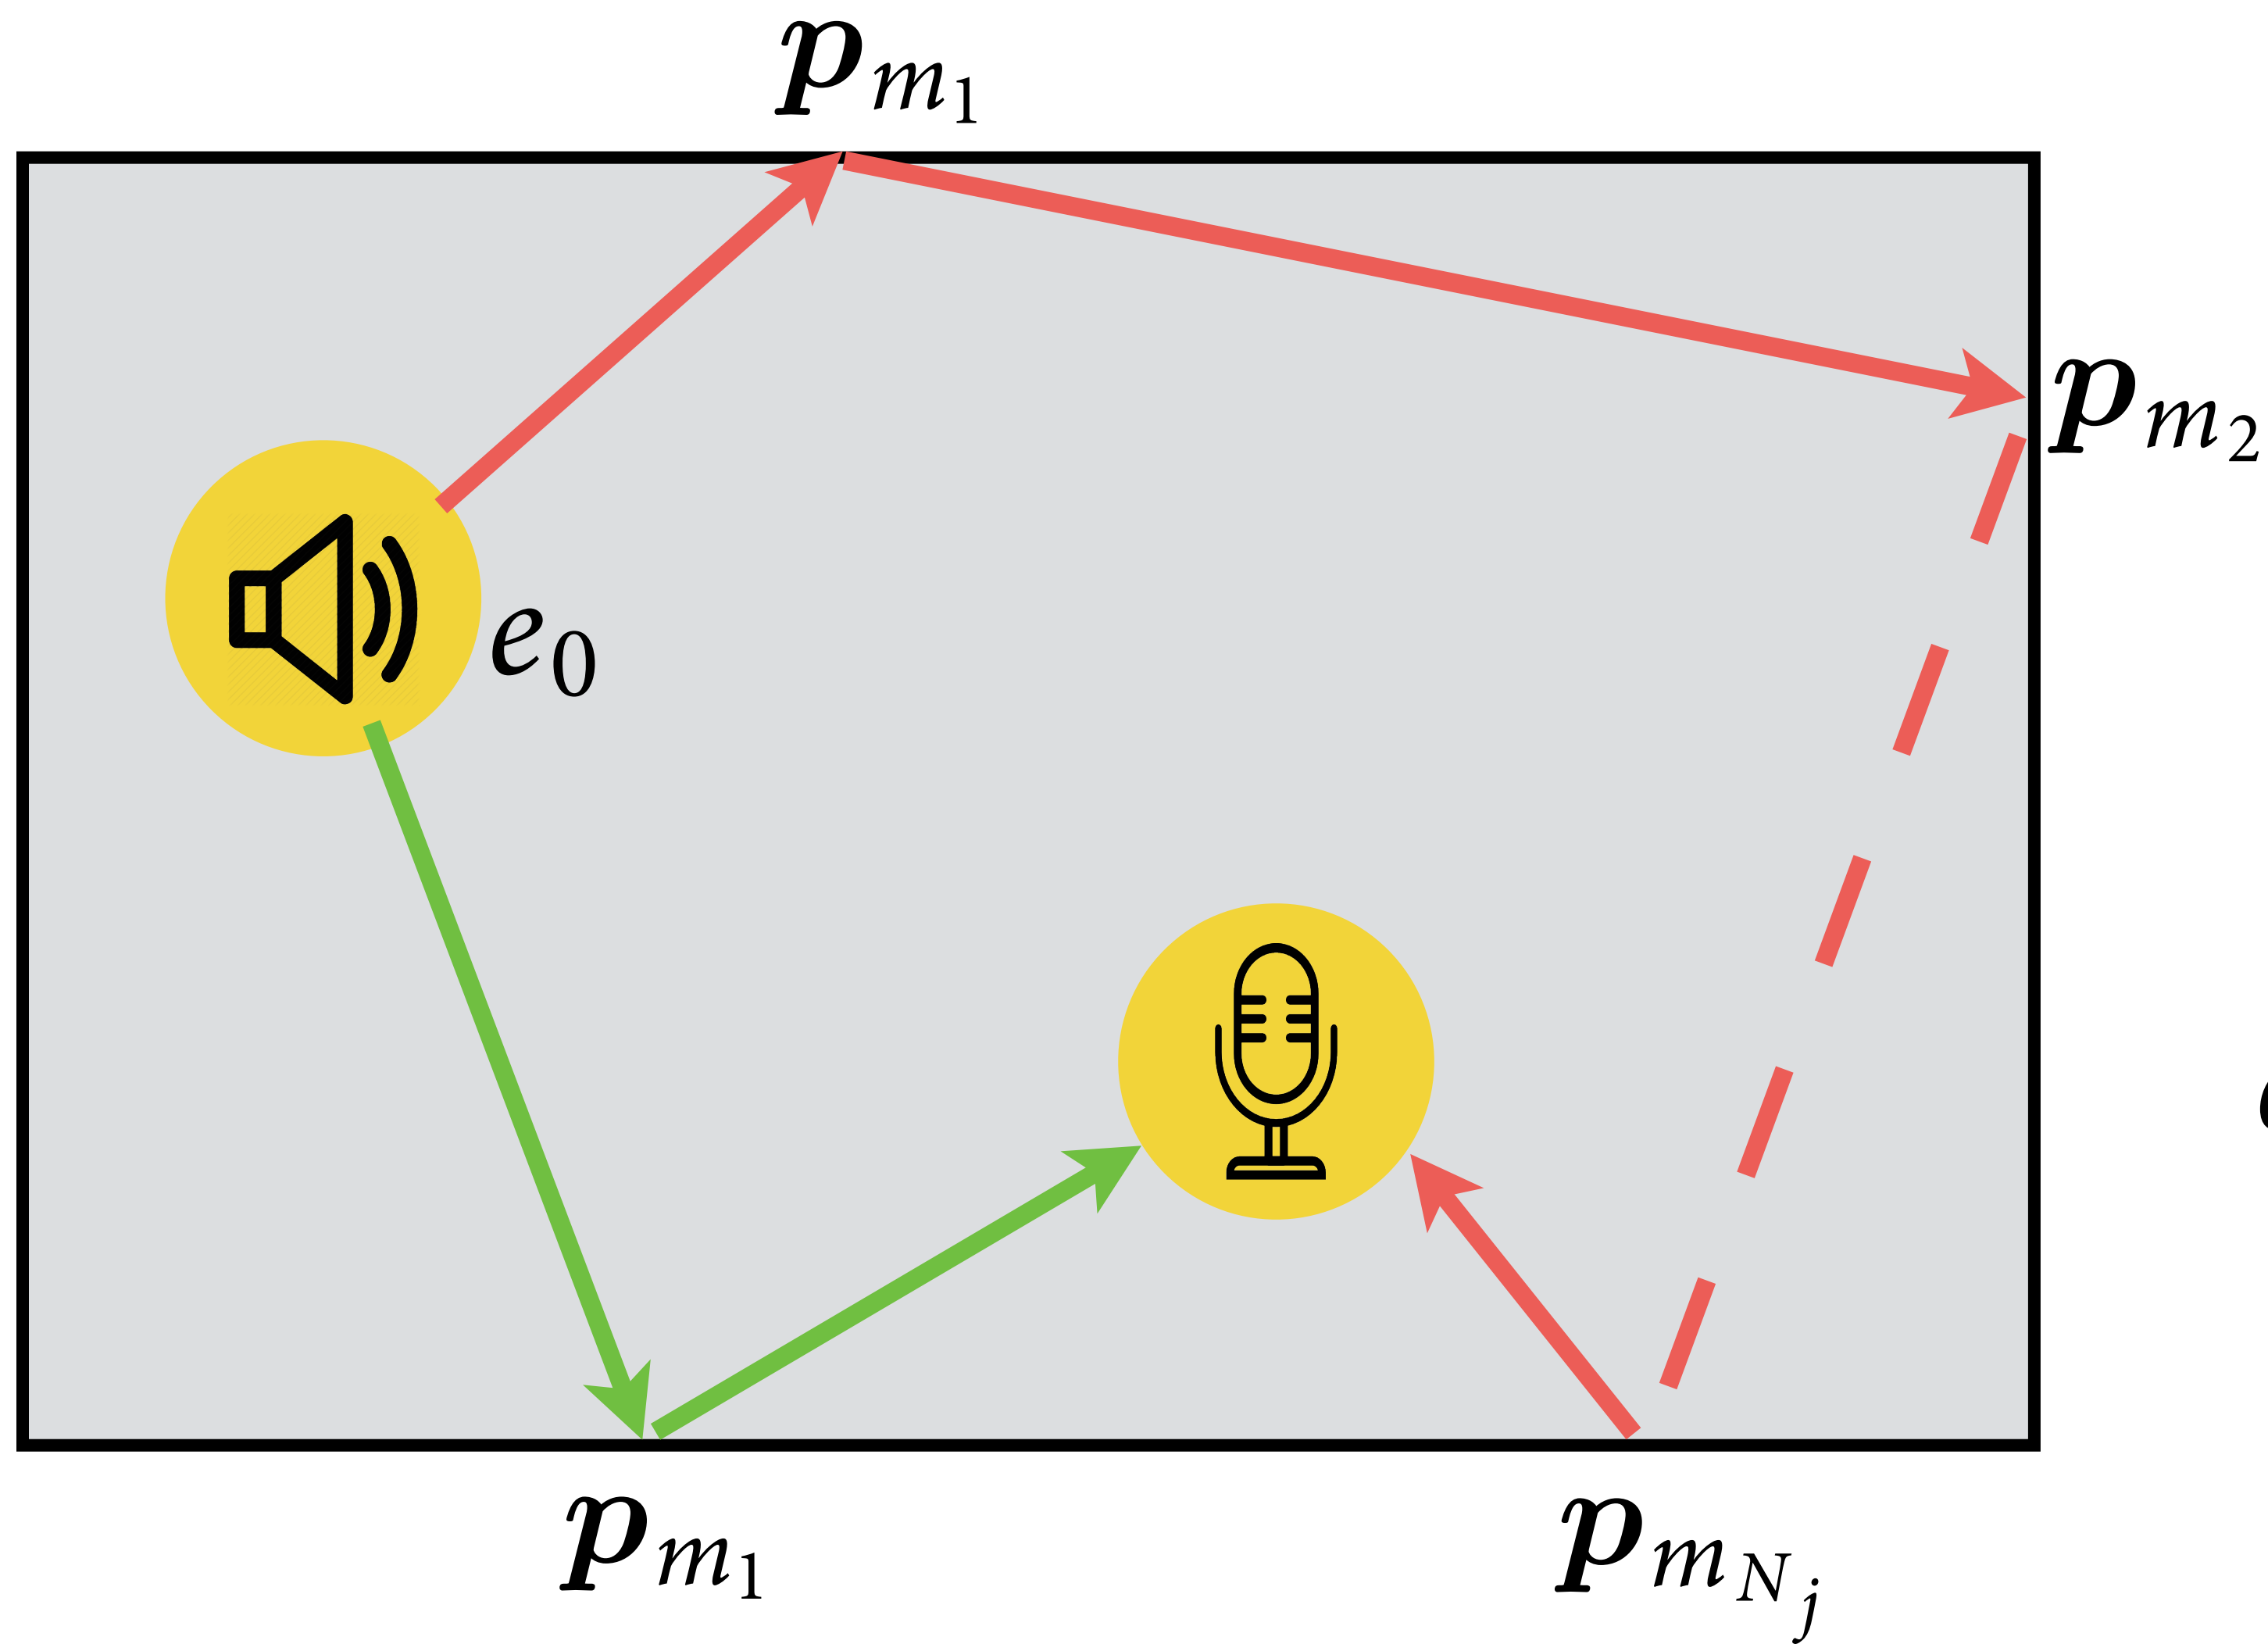

Measurement Setup

Impulse Response

Geometric Acoustic Simulation

Material Optimization

$$e_j(\mathbf{p}) = e_0 \prod_{i=1}^{N_j} p_{m(i)}$$

Objective Function

$$J(\mathbf{p}) = \sum_{j=1}^M \left[\log_{10} \left(\frac{e_j(\mathbf{p})}{e_0} \right) - \log_{10} \left(\frac{\tilde{h}(t_j)}{\tilde{h}(\bar{t}_0)} \right) \right]^2$$

$$\frac{\partial J}{\partial p_i} = \left[\log_{10} \left(\frac{e_j(\mathbf{p})}{e_0} \right) - \log_{10} \left(\frac{\tilde{h}(t_j)}{\tilde{h}(\bar{t}_0)} \right) \right] \frac{\partial e_j}{\partial p_i}$$

- 2 analytic gradient
- 20x speedup

Limitation of Geometric Acoustics

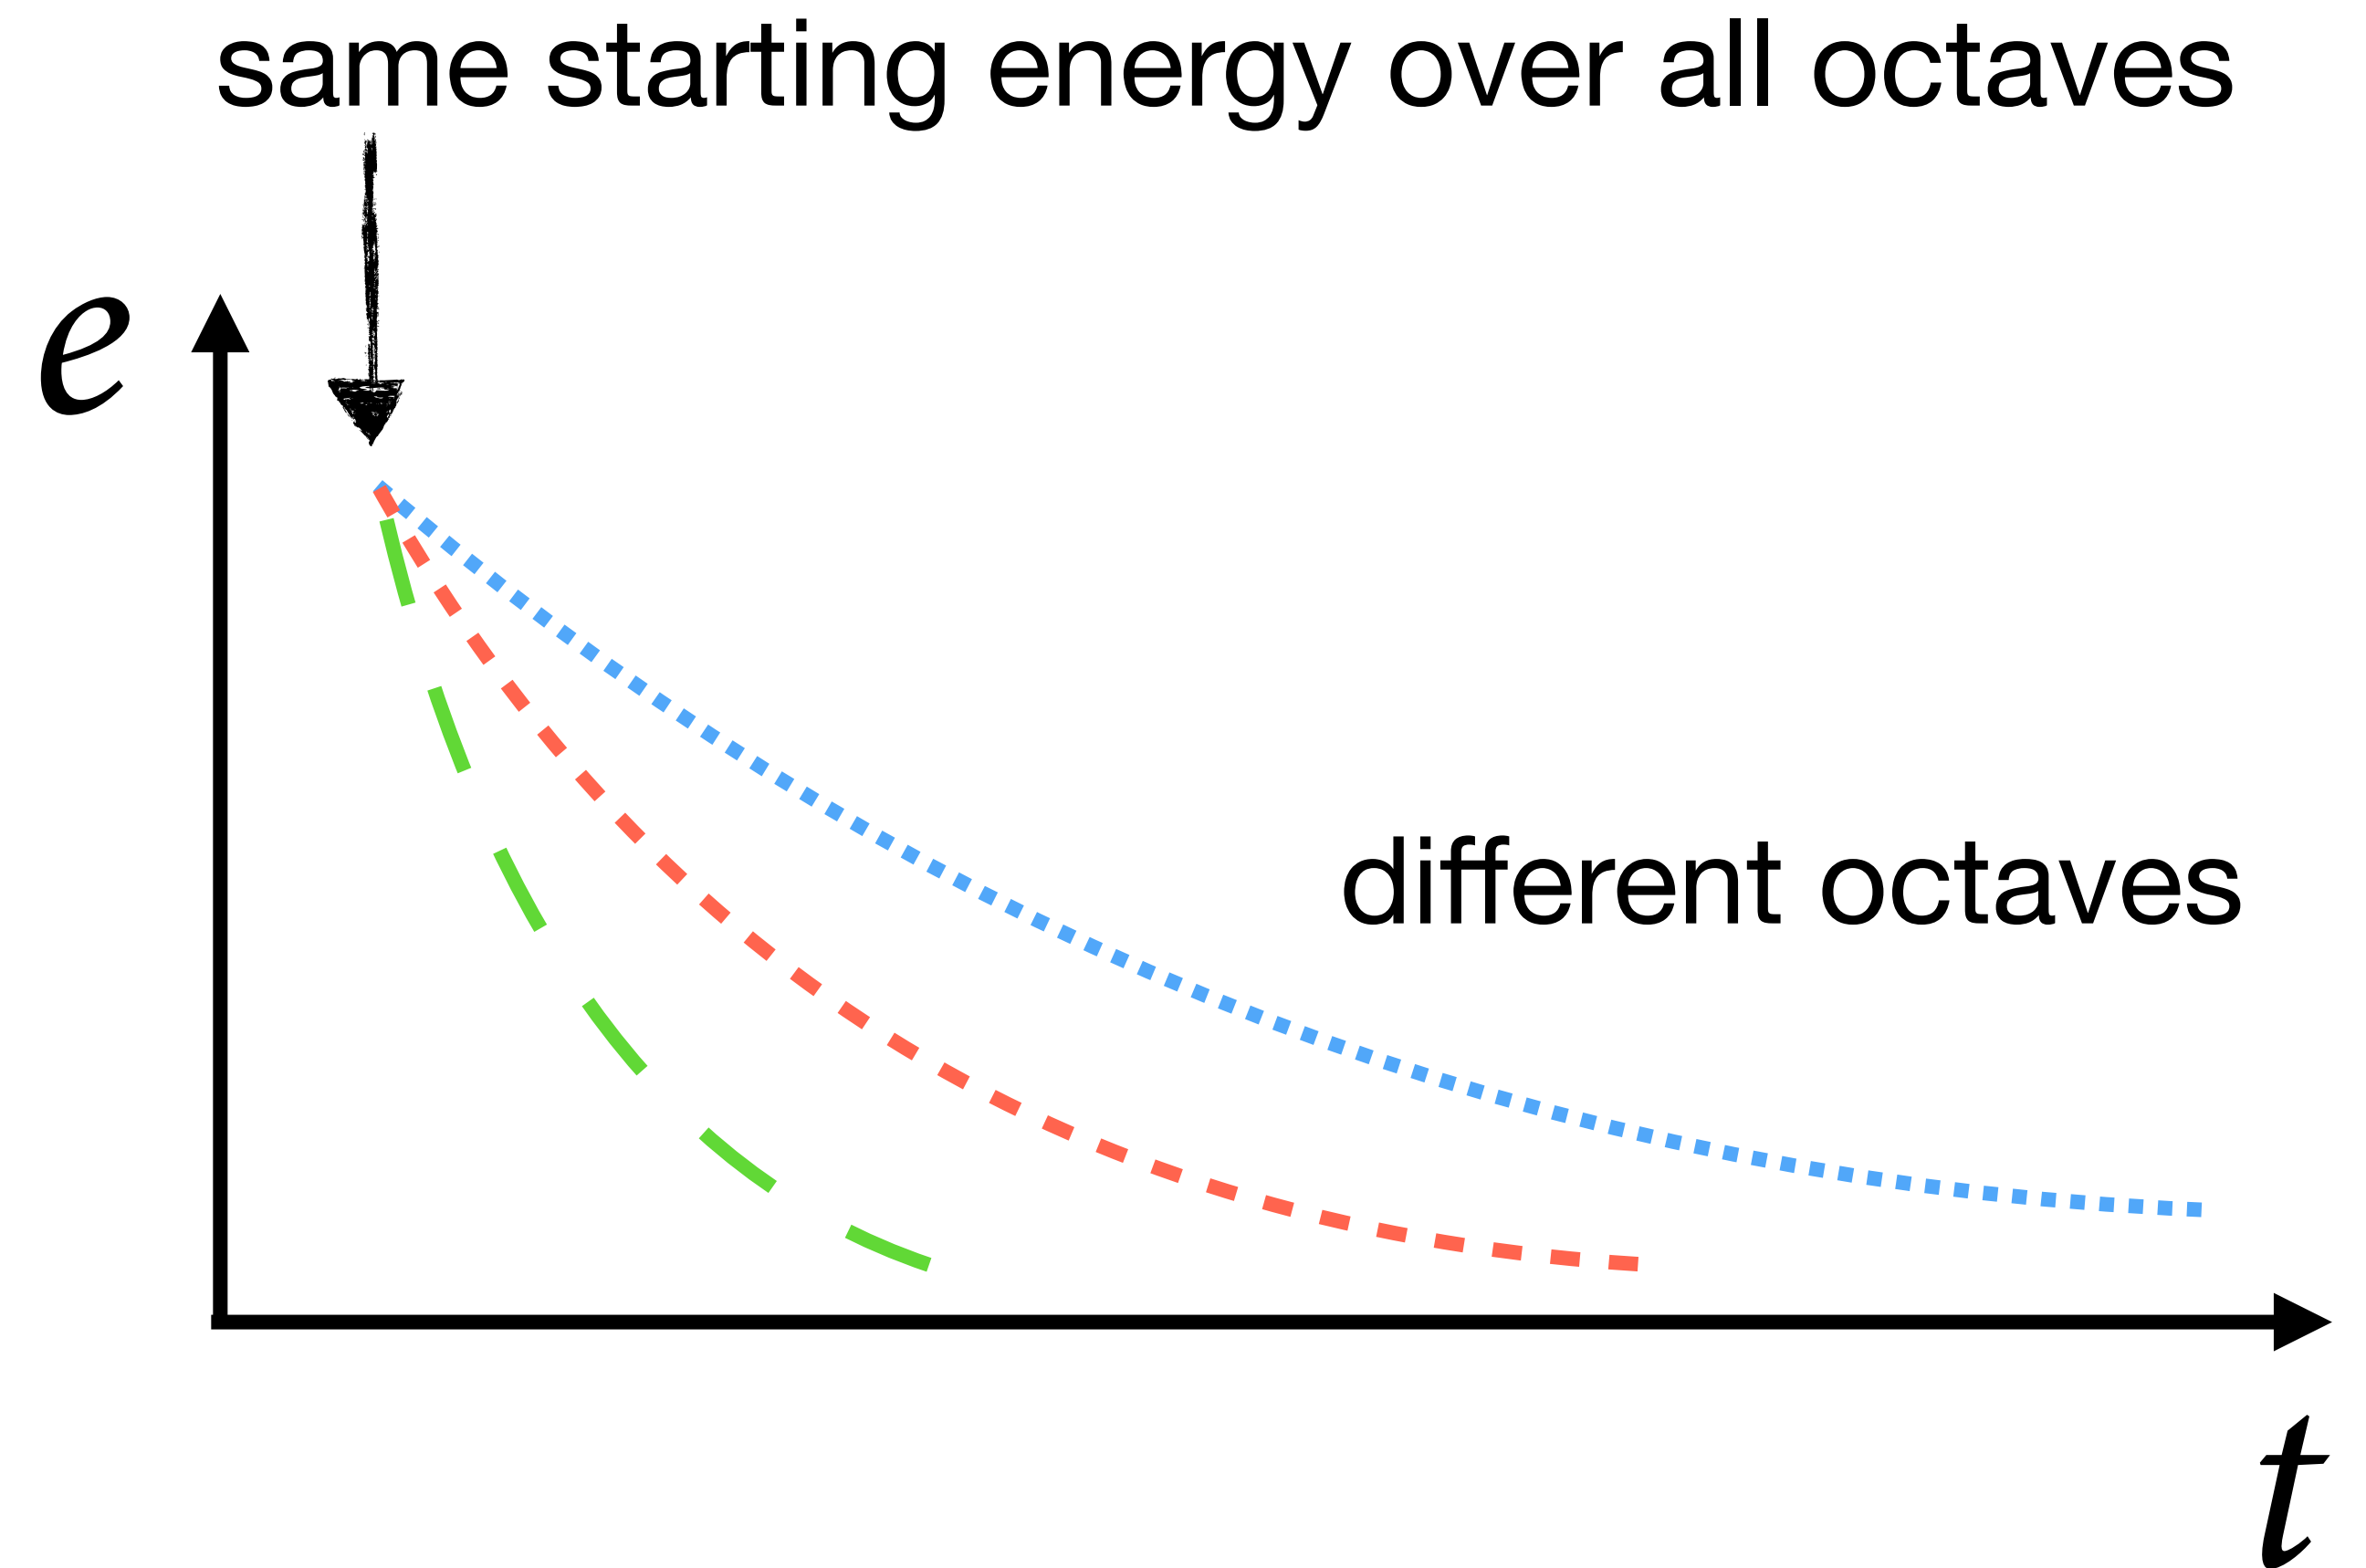

light rays ~ sound waves

inaccurate approximation for
low frequencies

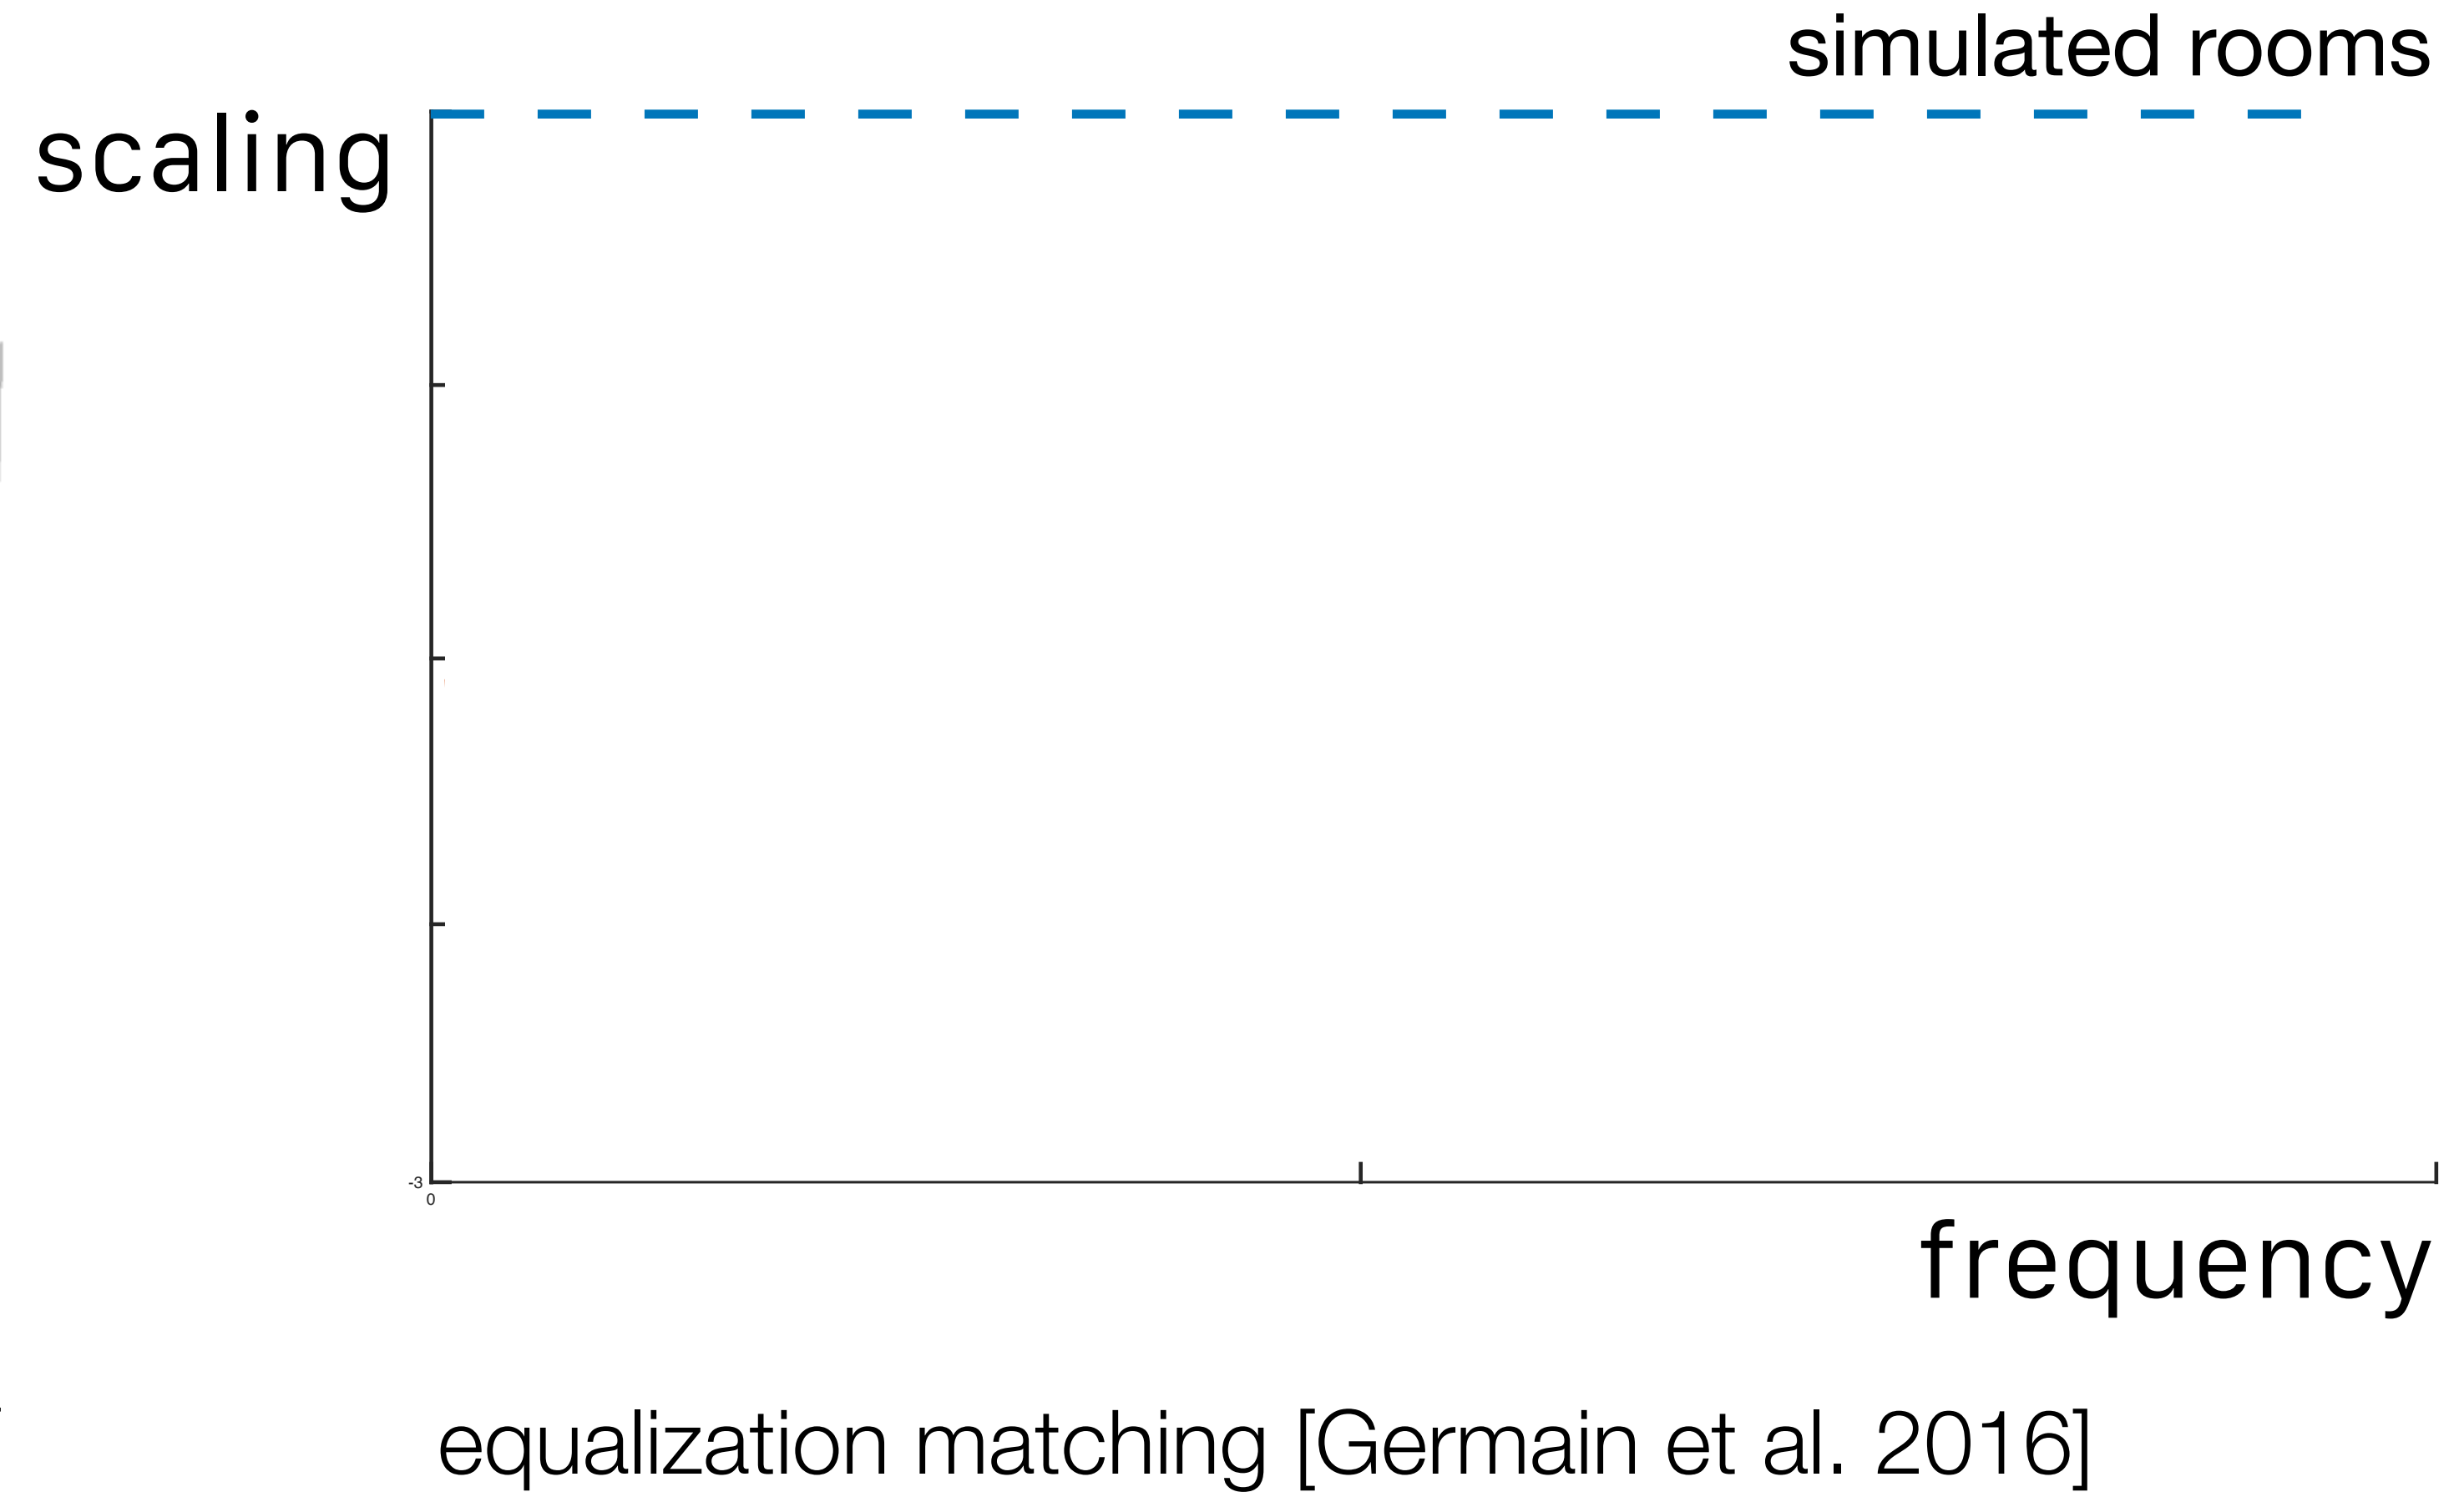

rooms are acoustic filters.

resonant frequencies and modes

Geometric Acoustics for Different Frequencies

Real-World Frequency Modulation

Pipeline Recap

room material optimization

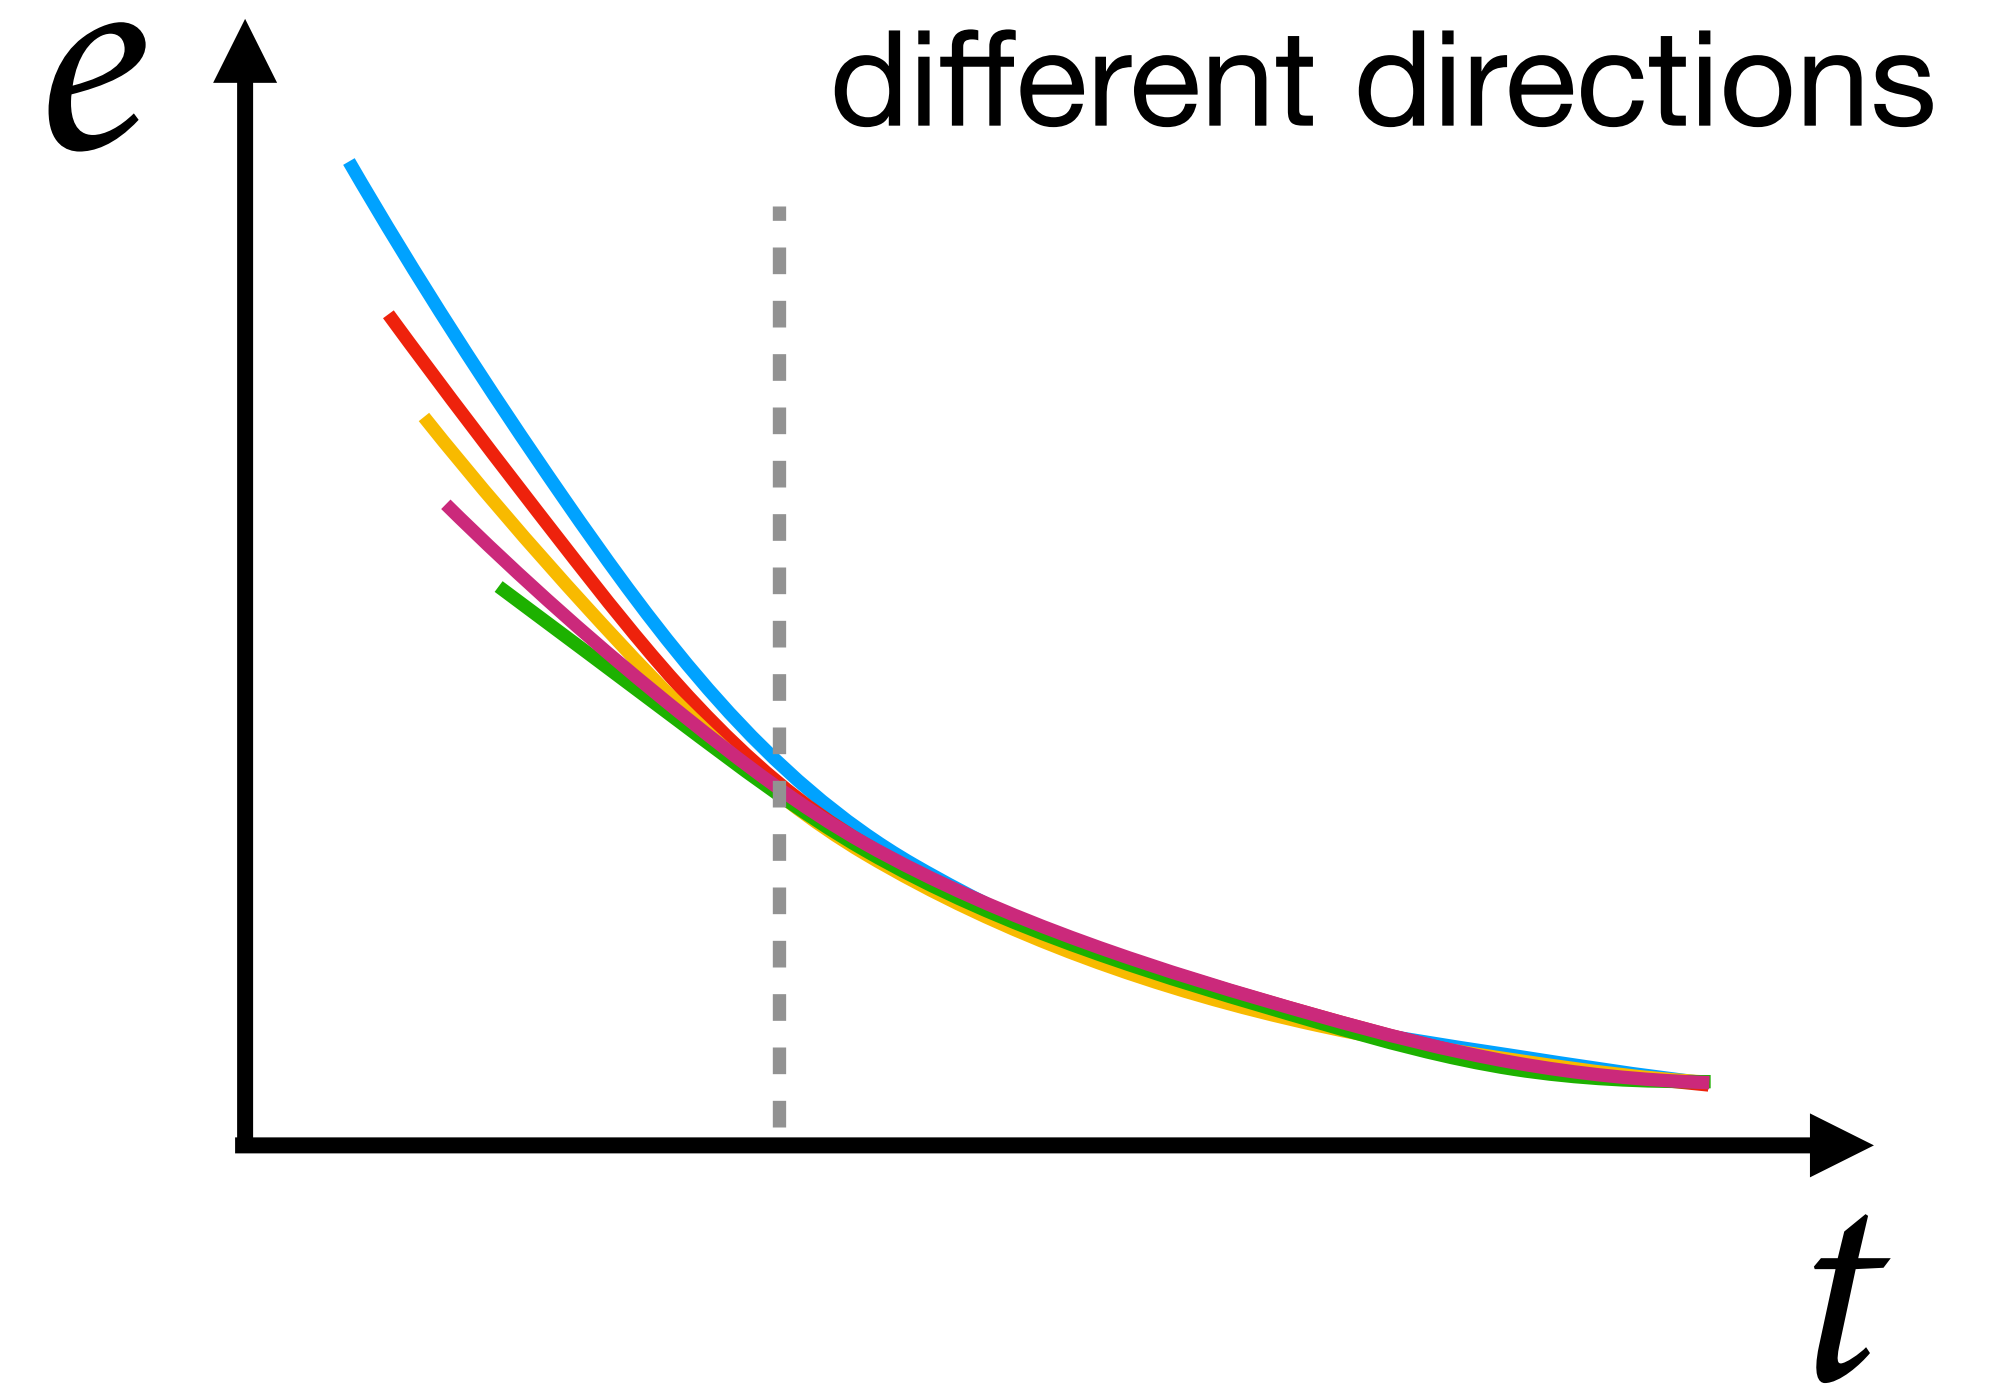

frequency modulation

hybrid synthesis

Isotropy Measurement

Hybrid Synthesis

Optimized Early Reflections

- fast simulation
- directionality

Late Tail

- summation over diffuse tail
- easy implementation
- efficient computation

Validation and Applications

headphones recommended

Validation

dry audio initial parameters with optimization with modulation recording

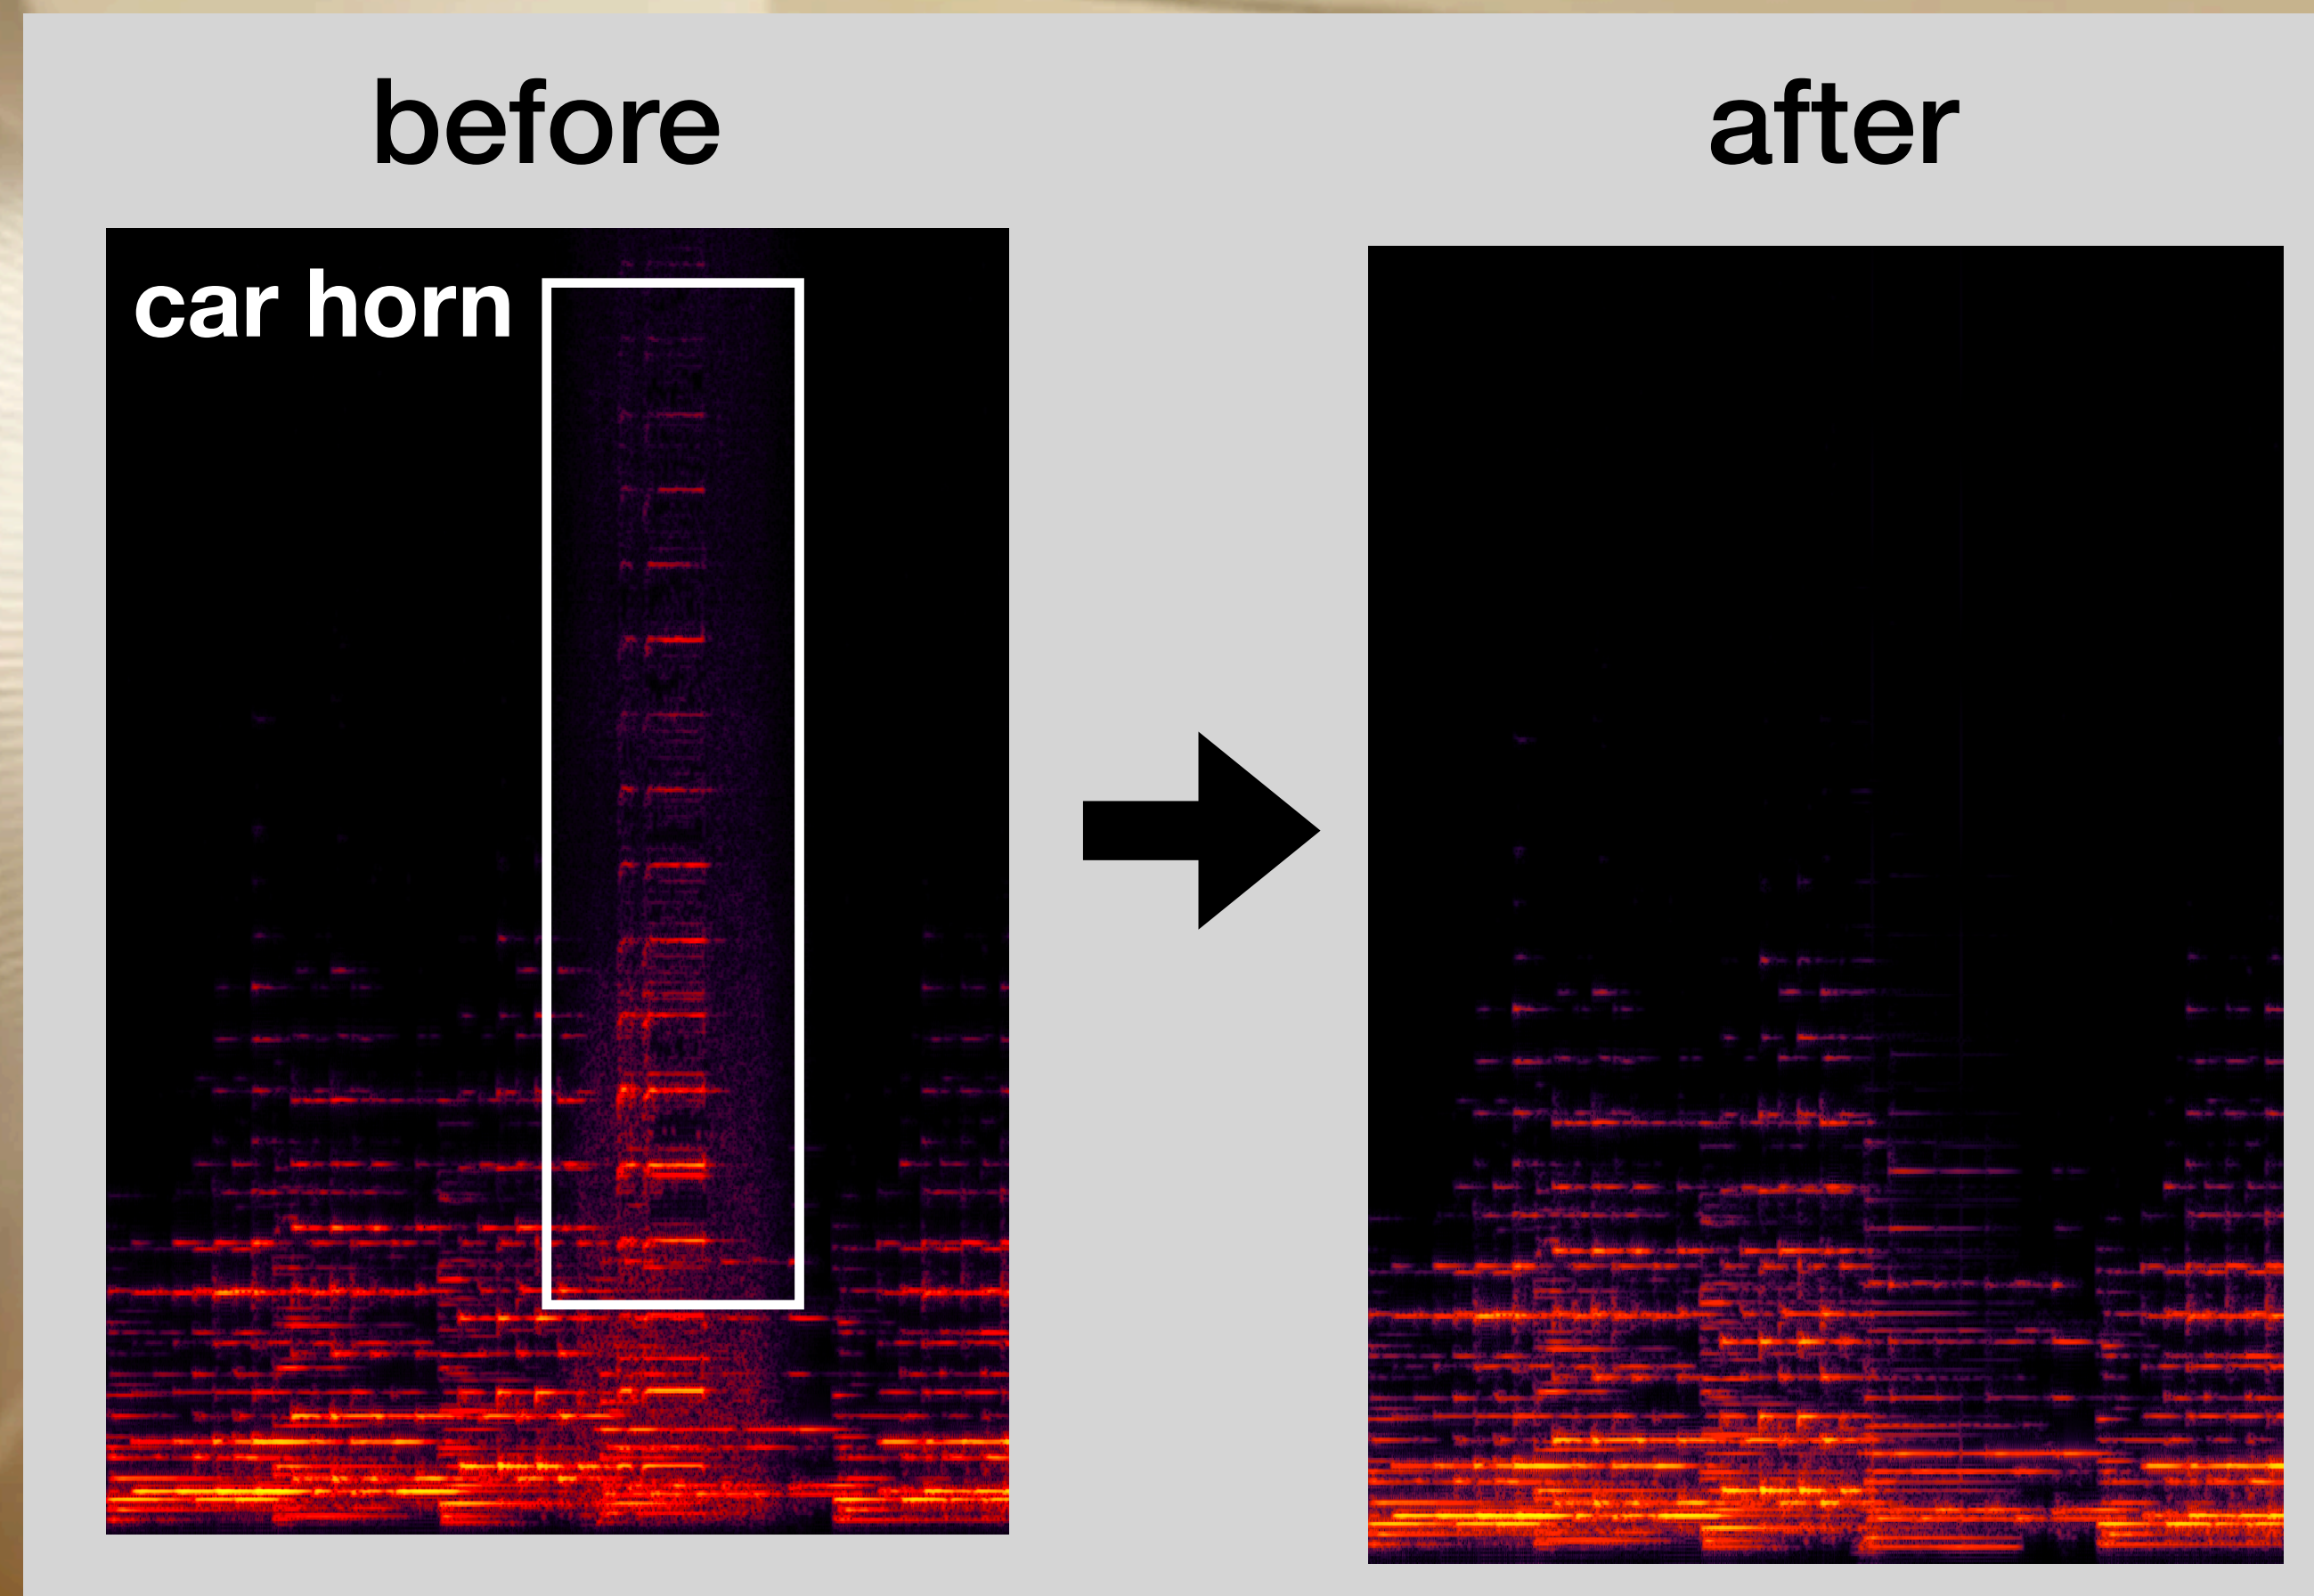

Dynamic Blending Validation

virtual sound source

our results

ambisonic recording

Noise Removal in Spatial Audio

contaminated recording

clean synthesized audio

Occlusion Effects

virtual sound source

recording

synthesized audio

Multi-room Geometric Effects

Re-spatialization of Mono-channel Audios

2D-3D conversion in movies

Re-spatialization in 360° videos

Re-spatialization

Left

input: mono-channel audio

Right

output: re-spatialized audio

Re-spatialization

Left

Right

input: mono-channel audio

output: re-spatialized audio

Conclusion

Scene-Aware Spatial Audio for 360° Videos

matched the indoor scenes

optimized simulation parameters

efficient hybrid sound synthesis

Limitations and Future Work

outdoor scenes

distance to the listener/sources

localized material estimation with multiple IRs

passive audio feature retrieval
