Objectives of our new vision-language task:

1. Auto-complete natural language queries conditioned on image as context.
2. Estimate probabilities of instances conditioned on a natural language query independent of bounding box, segmentation, attention mechanism.
3. Use 1 and 2 to select instances from a pre-segmented image.

Network Architecture

Image Query Auto-Completion Network

Instance Probability Network

Introduction

Context Based Query Auto-Completion

• Query Auto-completion (QAC) recently based on neural language models with word or character embeddings [lastnam 2018].
• Use FactorCell LSTM [lastname 2018], utilize CNN features as context.

Traditional LSTM

Appending context c to character embedding w and hidden state h equivalent to augmenting bias.

\[ h_t = \sigma ([w_{t}, h_{t-1}, c]W + b) \]

FactorCell LSTM

Add context dependent weight matrix A.

\[ Z_t \in \mathbb{R}^{h \times c}, Z_{\text{c}} \in \mathbb{R}^{h \times (c+i)} \]

\[ A = (c \times Z_{l}Z_{t})3 \times c \]

\[ W' = W + A \]

\[ h_t = \sigma ([w_{t}, h_{t-1}]W' + b) \]

Estimating Instance Probabilities

• Input completed query into fine-tuned BERT and output probabilities for each object class appearing in region using a sigmoid cross entropy loss.

Datasets

• Subset of Visual Genome, and ReferIt datasets.
• Training query to instance probabilities network: use region descriptions in place of queries and associated objects as ground truth.

<table>
<thead>
<tr>
<th>Dataset</th>
<th>Avg. Characters per Query</th>
</tr>
</thead>
<tbody>
<tr>
<td>ReferIt</td>
<td>16.9 (SD = 12.3)</td>
</tr>
<tr>
<td>Visual Genome</td>
<td>26.2 (SD = 8.5)</td>
</tr>
</tbody>
</table>

Example Results

Comparison of image query auto-completion perplexity using image vs. noise for each dataset. As expected image context results in a lower (better) perplexity.

Comparison of image query auto-completion MRR results for VG (left) and ReferIt (right) using the image vs. noise. Horizontal axis denotes varying prefix lengths as percentage of total query length and context. MRR improves when increasing query prefix length, and is better when using images.

Instance Probability Network Results: 0.7618 F1-Score on 2,909 classes
