1987: Amiga 2000

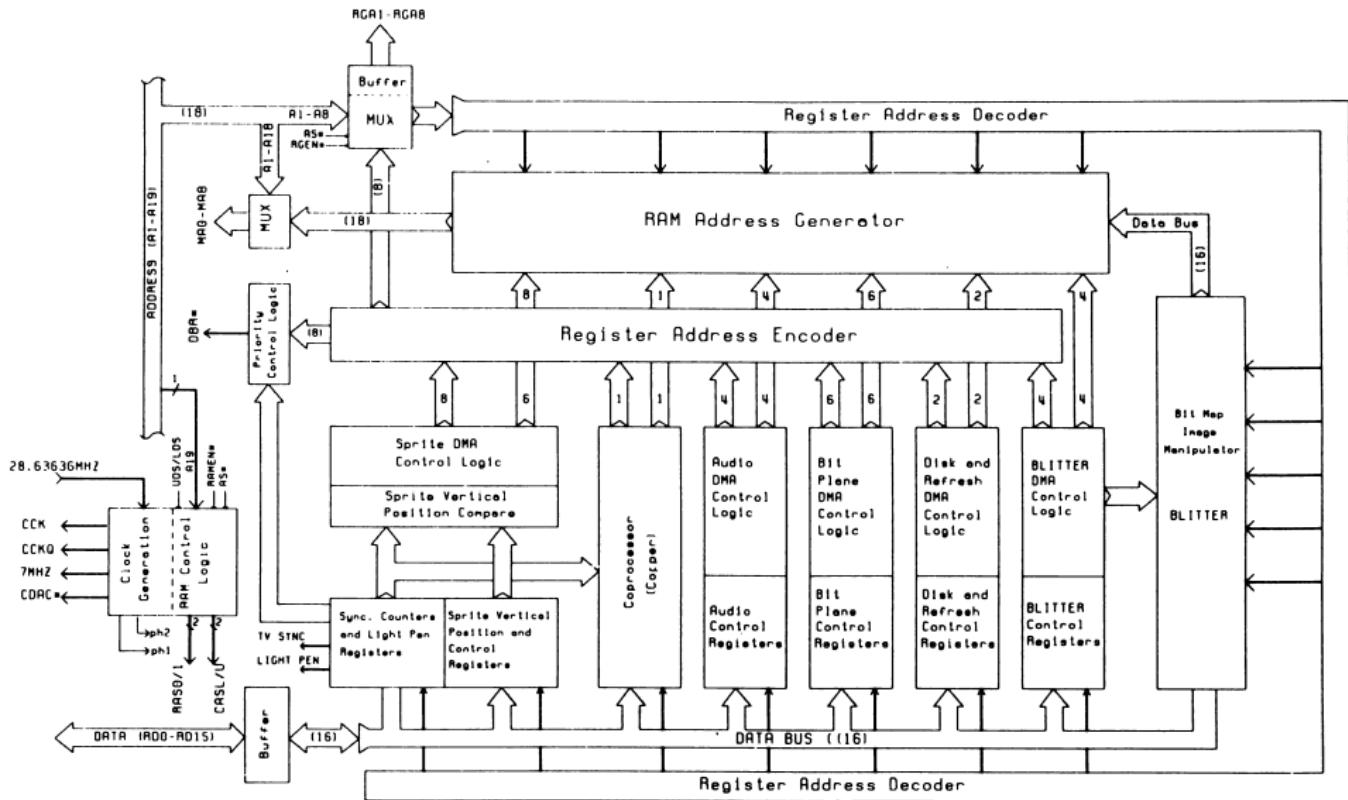

- ▶ Motorola 68000 @ 7.16 MHz
- ▶ 512 KB “Chip” +
512 KB “fast” RAM
- ▶ 512K ROM (w/ OS)
- ▶ 4096 colors
- ▶ 640×400 interlaced
- ▶ 6 bitplanes
- ▶ 8 sprites/scanline
- ▶ 4 8-bit audio @ 24 kHz
- ▶ Hardware blitter

Fat Agnus

- ▶ Blitter
- ▶ Display Synchronized Coprocessor (“Copper”)
- ▶ 25 Channel DMA controller
- ▶ System clock generator
- ▶ DRAM controller

Denise

- ▶ 320×200 to 640×400 resolution (interlaced)
- ▶ 4096 colors
- ▶ Eight sprite controllers
- ▶ Sprite collision detection
- ▶ 60 or 80 column text

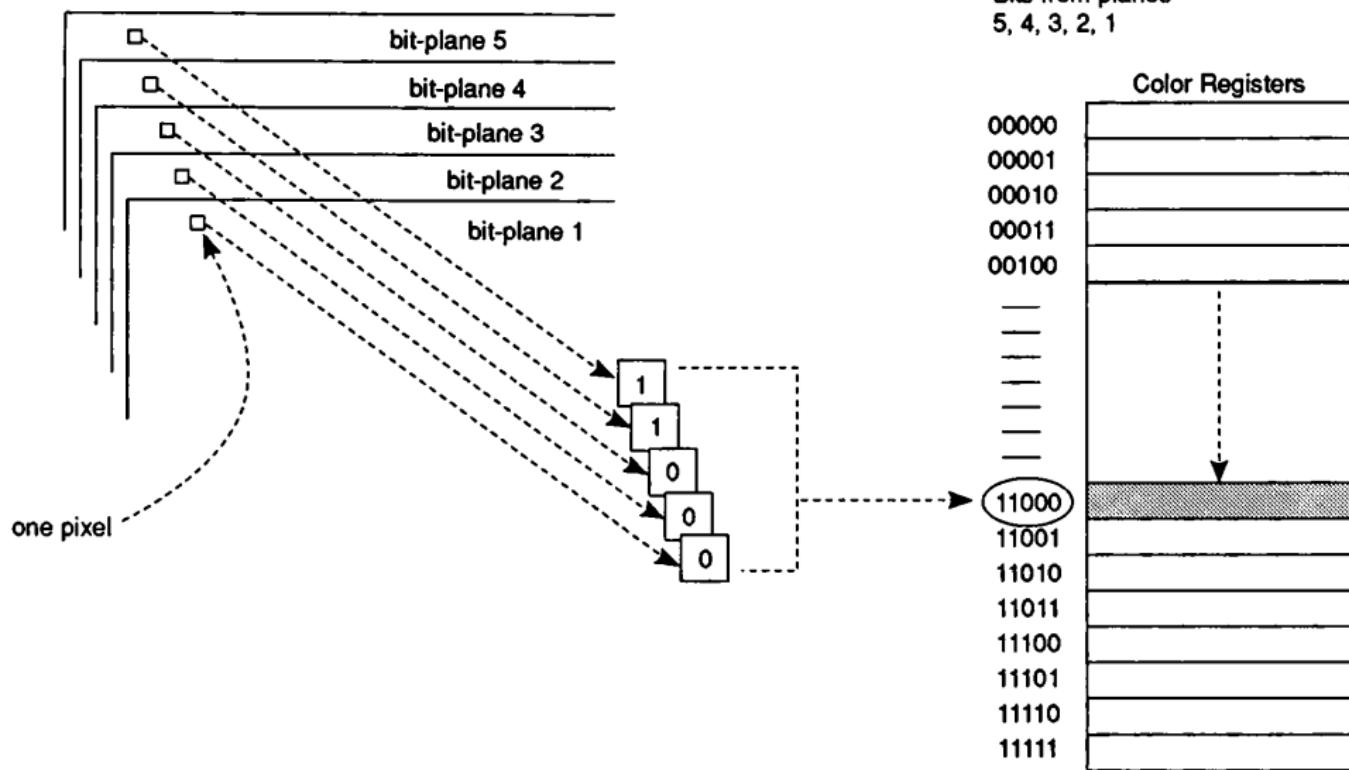

Figure 3-3: How Bitplanes Select a Color

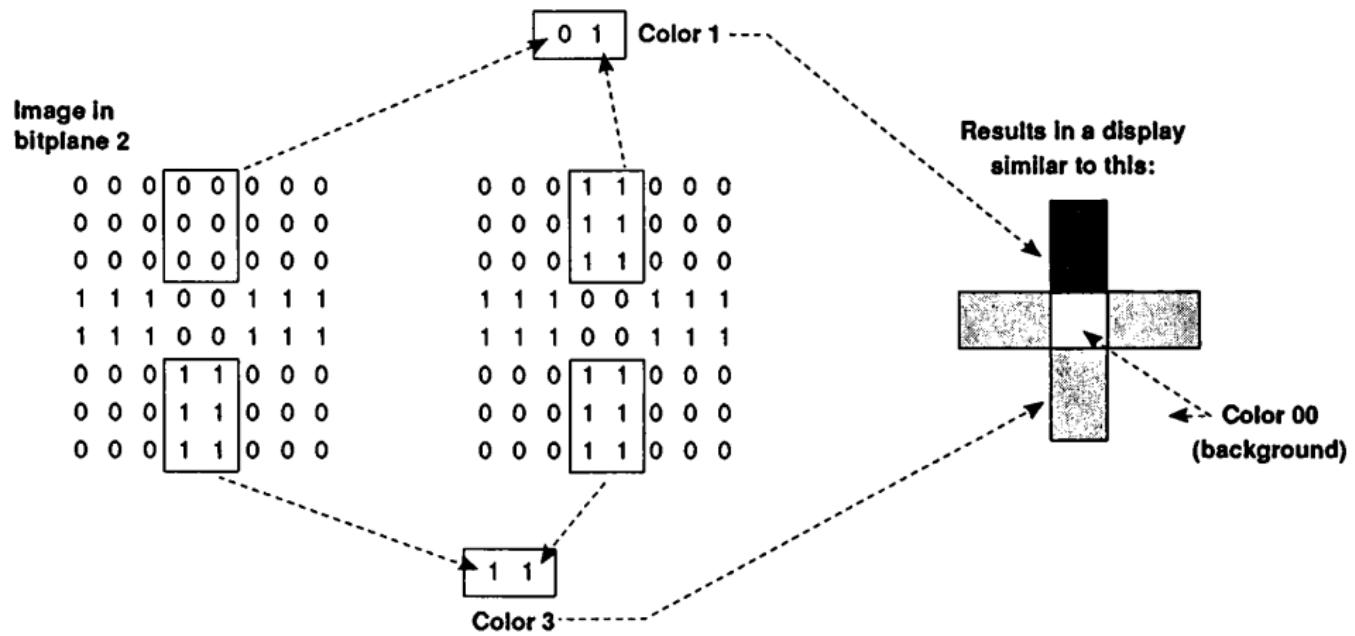

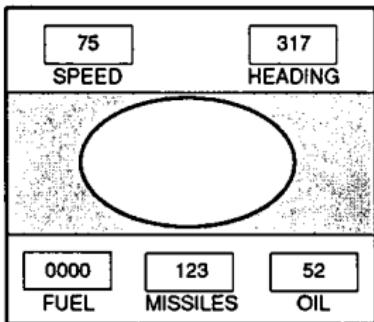

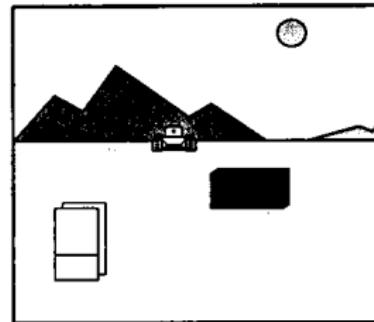

Figure 3-8: Combining Bitplanes

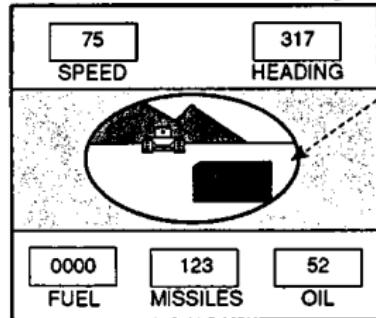

Playfield 1
(1, 2 or 3 bitplanes)

Playfield 2
(1, 2 or 3 bitplanes)

Both playfields appear on screen, combined to form the complete display.

The background color shows through where there are transparent sections of both playfields.

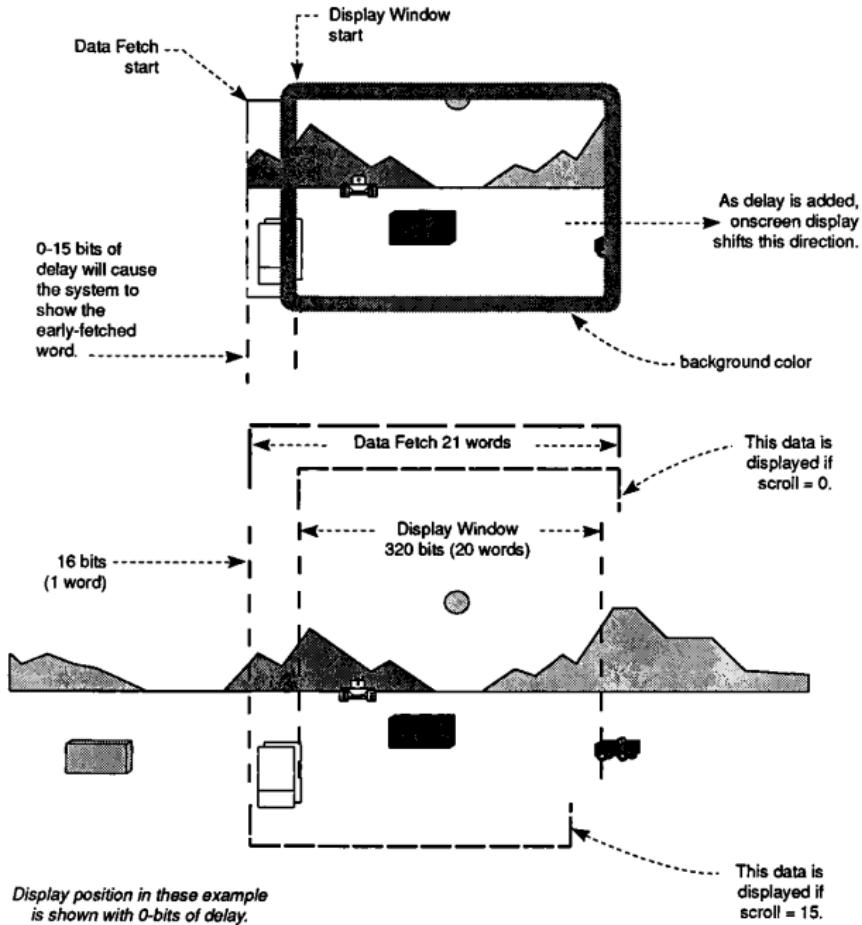

Figure 3-24: Horizontal Scrolling

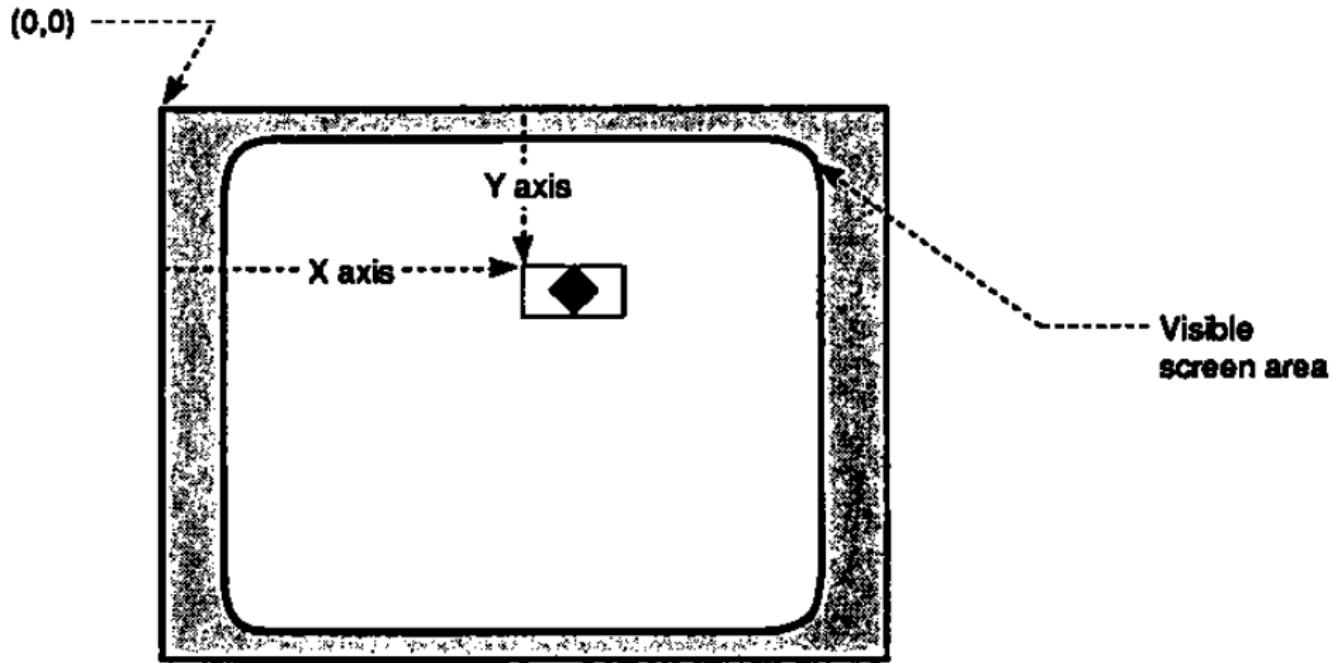

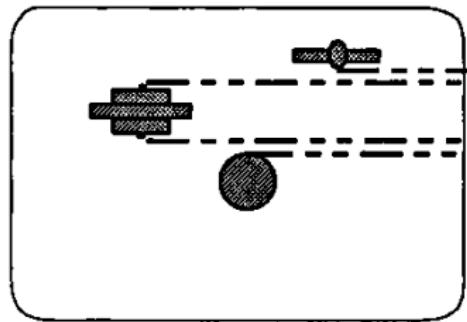

Figure 4-1: Defining Sprite On-screen Position

Part of a screen display

Each image of this sprite may be placed at any desired spot, horizontally or vertically. However, at least one video line must separate the bottom of one usage of a sprite from the starting point of the next usage.

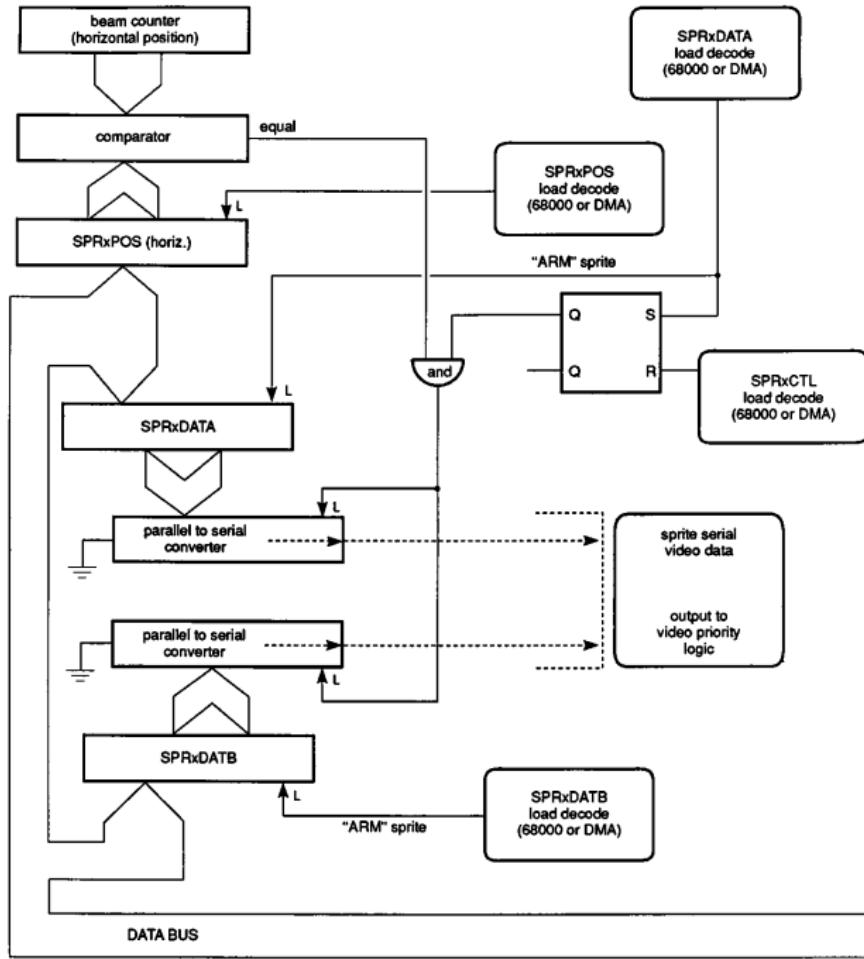

Figure 4-13: Sprite Control Circuitry

COLOR SELECTION IN HOLD-AND-MODIFY MODE

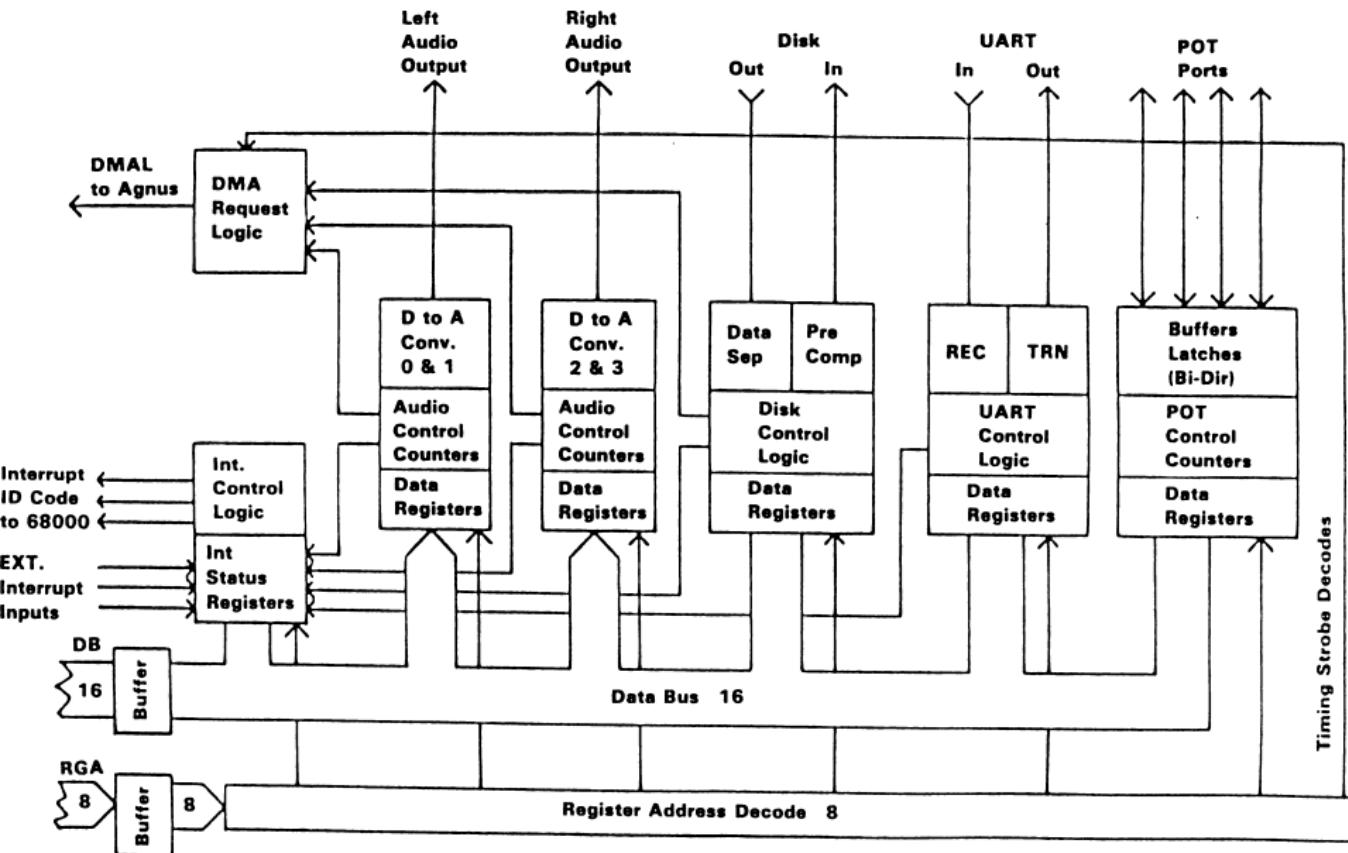

In hold-and-modify mode, the color register contents are changed as shown in Table 3-19. This mode is in effect only if bit 10 of BPLCON0 = 1.

Bitplane 6	Bitplane 5		Result
0	0	Normal operation	(use color register itself)
0	1	Hold green and red	B = Bitplane 4-1 contents
1	0	Hold green and blue	R = Bitplane 4-1 contents
1	1	Hold blue and red	G = Bitplane 4-1 contents

Table 1-19: Color Selection in Hold-and-modify Mode

Paula

- ▶ Four voices; two channels
- ▶ Nine octaves
- ▶ Complex waveforms
- ▶ Both amplitude and frequency modulation
- ▶ I/O controller for disk and controller ports
- ▶ Floppy controller
- ▶ Interrupt controller
