Lectures

Homeworks

The CLIC Lab

Responsibility

Practical Focus

What is Security?

- Security is a property of the overall design
- You do *not* get security by sprinkling on crypto or by forcing people to change their passwords frequently
- Those can sometimes help — but bad guys go around strong security, not through it

Introduction

What is this Course?

Lectures

Homeworks

The CLIC Lab

Responsibility

Practical Focus

What is Security?

- The bad guys don't follow the rules
- To understand how to secure a system, you have to understand what sort of attacks are possible
- Note that that is *not* the same as actually launching them...

The CLIC Lab

Responsibility

Practical Focus

What is Security?

- Lecture format
- Syllabus subject to change to discuss current events
- Approximate grading percentages:

Homework	50%
Midterm	20%
Final	30%

The percentages will be adjusted slightly if there are only four homework assignments.
- Grades will be posted on Courseworks
- Yes, I curve

Practical Focus

What is Security?

- *The Craft of System Security*, Sean Smith and John Marchesini, Addison-Wesley, 2008, ISBN 0-321-43483-8.
- Some primary source material — I assume you all know how to use the library and/or electronic resources. (Hint: Google does not (yet?) have access to all of the world's knowledge.)
- Note: ACM and IEEE readings are often only easily available from the campus network.

What is Security?

- For grading issues, approach the TA within two weeks; if you don't receive a satisfactory answer, contact me.
- For issues relating to *this class*, email [smb+4187@cs...](mailto:smb+4187@cs.cu.edu)
- That lets me auto-sort class-related mail and keep better track of things

Programming Assignments

- All programming homework *must* be done in C or C++ unless otherwise instructed. Don't bother asking for exceptions.
- Turn in a single tar file, including a Makefile.
- If necessary, include test data and a README file with execution instructions
- All programs *must* compile and run on Linux, on the CLIC machines
- Zero credit for programs that don't compile.
- Because most security problems are due to buggy code, there will be copious deductions for bugs or for inadequate documentation

Practical Focus

What is Security?

- Discussing homework with others is encouraged
- All programs and written material *must* be individual work unless otherwise instructed.
- Please use appropriate file permission mechanisms to protect your homework. (Looking at other people's work is forbidden.)
- Zero tolerance for cheating
- See the department's honesty policy:
<http://www.cs.columbia.edu/education/honesty>
I will assume that you have all read it; you are in any event responsible for its terms and provisions.

What is Security?

- Taking a computer security class is *not* an excuse for hacking
- “Hacking” is any form of unauthorized access, including exceeding authorized permissions
- The fact that a file or computer is not properly protected is no excuse for unauthorized access
- *If* the owner of a resource invites you to attack it, such use is authorized
- For more details, see http://www.columbia.edu/cu/policy/network_use.ht
- *Absolutely no Trojan horses, back doors, or other malicious code in homework assignments*

What is Security?

- Feel free to drop in during office hours.
- I'll announce changes on my home page
- I'm amenable to meeting other times, by appointment. You're welcome to drop in if my office door is open, but I reserve the right to ask you to come back later
- If you have any questions, please use email rather than telephone; I travel a lot and am not very reachable by phone

Homeworks

The CLIC Lab

Responsibility

Practical Focus

What is Security?

- As noted, four or five homework assignments
- Homeworks are designed for practice, teaching, and evaluation
- Homeworks must be submitted electronically by the start of class
- Homeworks received later that day lose 5%, the next day 10%, two days late 20%, three days late 30%; after that, zero credit
- Exceptions granted only for *unforeseeable* events. Workload, day job, etc., are quite foreseeable.
- Problems? See me *before* the due date

- All programs *must* run on the CLIC machines: <http://www.cs.columbia.edu/CLIC>)
- Programs that don't compile *on those machines* receive zero credit
- You need a CS account to use CLIC; see <https://www.cs.columbia.edu/~crf/accounts/>
- Some of the CLIC machines are for in-person use; others can only be accessed remotely

Practical Focus

What is Security?

- This is not a pure academic-style security course
- You'll be experimenting with real security holes
- A lot of (in)security is about doing the unexpected
- The ability to “think sideways” is a big advantage

Designing Security

What this Course is

About

Security is keeping unauthorized entities from doing things you don't want them to do.

This definition is too informal...

What is Security?

The Human Element

Engineering

Designing Security

What this Course is

About

- Confidentiality
- Integrity
- Availability

- “The property that information is not made available or disclosed to unauthorized individuals, entities, or processes [i.e., to any unauthorized system entity].” [definitions from RFC 2828]. Not the same as *privacy*.
- **Privacy:** “The right of an entity (normally a person), acting in its own behalf, to determine the degree to which it will interact with its environment, including the degree to which the entity is willing to share information about itself with others.” Privacy is a reason for confidentiality
- The traditional focus of computer security

Threats

The Human Element

Engineering

Designing Security

What this Course is

About

- **data integrity:** “The property that data has not been changed, destroyed, or lost in an unauthorized or accidental manner.”
- **system integrity:** “The quality that a system has when it can perform its intended function in a unimpaired manner, free from deliberate or inadvertent unauthorized manipulation.”
- Often of more commercial interest than confidentiality

- “The property of a system or a system resource being accessible and usable upon demand by an authorized system entity, according to performance specifications for the system; i.e., a system is available if it provides services according to the system design whenever users request them.”
- Turning off a computer provides confidentiality and integrity, but hurts availability...
- Denial of service attacks are direct assaults on availability

They Interact

The Human Element

Engineering

Designing Security

What this Course is
About

- It's obvious that violations of integrity can be used to compromise confidentiality
- In some situations, violations of availability can be used that way as well

More Definitions

Designing Security

What this Course is

About

vulnerability An error or weakness in the design, implementation, or operation of a system

attack A means to exploit some vulnerability in a system

threat An adversary that is motivated and capable of exploiting a vulnerability

(Definitions from *Trust in Cyberspace*)

Designing Security

What this Course is

About

- The technical failing in a system
- The primary focus of most computer security classes
- If you can close the vulnerabilities, the threats don't matter
- Or do they?

- Introduction
- What is Security?
- What is Security?
- What is Security?
- Confidentiality
- Integrity
- Availability
- They Interact
- More Definitions
- Vulnerabilities
- Threats**
- The Human Element
- Engineering
- Designing Security
- What this Course is About

- Different enemies have different abilities
- Teenage joy-hackers can't crack a modern cryptosystem
- Serious enemies can exploit the “three Bs”: burglary, bribery, and blackmail
- You can't design a security system unless you know who the enemy is

The Human Element

- Introduction
- What is Security?
- What is Security?
- What is Security?
- Confidentiality
- Integrity
- Availability
- They Interact
- More Definitions
- Vulnerabilities
- Threats
- The Human Element**
- Engineering
- Designing Security
- What this Course is About

“Humans are incapable of securely storing high-quality cryptographic keys, and they have unacceptable speed and accuracy when performing cryptographic operations. They are also large, expensive to maintain, difficult to manage, and they pollute the environment. It is astonishing that these devices continue to be manufactured and deployed, but they are sufficiently pervasive that we must design our protocols around their limitations.”

Network Security: Private Communication in a Public World, Kaufman, Perlman, and Speciner

The Human Element

Engineering

Designing Security

What this Course is

About

- Sometimes, requirements are inconsistent and/or incomplete
- Conflicts:
 - ◆ Security versus cost
 - ◆ Security versus performance
 - ◆ Security versus acceptability and culture
 - ◆ Security versus usability
 - ◆ Security versus security!
- We'll discuss how to detect and analyze such conflicts

Introduction

What is Security?

More Definitions

Vulnerabilities

Threats

The Human Element

Engineering

Designing Security

What this Course is

About

- The problem is overconstrained
- Among the constraints are cost, human behavior, and ease of operation
- In the real world, realistic security is often far more important than theoretical security
- *What are you trying to protect against whom?*
