- Approximately 15-20 questions
- I'm not asking you to write programs
- Three types of questions, more or less like the midterm's:
 - ◆ Explanations of certain concepts, above the pure memorization level
 - ◆ Carrying out tasks based on things discussed in class
 - ◆ Design questions (i.e., ones intended to make you think)

- If it's in my slides or I said it in class, you're responsible for it
- There will be some material based more on Tanenbaum or other assigned reading; there won't be much from Linux internals
- You're responsible for the assigned readings at about the level of class coverage.
- I'm not going to ask you to memorize the crazy synchronization algorithms, but if one shows up you should be prepared to explain it

- I can't quiz you on everything I've covered during the semester
- I can't review 30+ hours of class time today
- I'm to some extent limited by the kinds of things it's feasible to ask on an exam

- Why is it needed?
- Relocation
- Position-independent code: used for libraries
- Load-time relocation: good for initial load, but not for realloc
- Hardware assist: base/limit
- Memory protection
