COMS W4187: Security Architecture and Engineering

Prof. Steven M. Bellovin
http://www.cs.columbia.edu/~smb
Introduction

What is Security?

Security Primitives
Security Architecture
Security Engineering
How to Think About Security
How to Think About Insecurity...

Course Structure
Readings
Logistics
Programming Assignments
Co-operation versus Dishonesty
The Ethics of Security
Contacting Me
Talking to Me
Class Schedule
TAs
Lectures
Homeworks
The CLIC Lab
Responsibility
Practical Focus

What is Security?
What is Security?

- Security primitives
- Security architecture
- Security engineering
- How to think about security
  ⇒ How to think about insecurity...
- Not 4180 — complementary to it
Security Primitives

- What are the basic mechanisms you can use to secure a system?
- What are the properties of these mechanisms?
- What is the assurance associated with them?
Security Architecture

- How to put the pieces together
- How to spot the risky parts
- How to evaluate an architecture
What is Security?

- Putting the pieces together
- Tradeoffs
- Balancing cost, security, usability, acceptability, and more
How to Think About Security

- Security is a property of the overall design
- You do *not* get security by sprinkling on crypto or by forcing people to change their passwords frequently
- Those can sometimes help — but bad guys go around strong security, not through it
The bad guys don’t follow the rules
To understand how to secure a system, you have to understand what sort of attacks are possible
Note that that is not the same as actually launching them...
Course Structure

- Lecture format
- Syllabus subject to change to discuss current events
- Approximate grading percentages:
  - Homework 50%
  - Midterm 20%
  - Final 30%
- Grades will be posted on Courseworks
- Yes, I curve
Mostly primary source material — I assume you all know how to use the library and/or electronic resources. (Hint: Google does not (yet?) have access to all of the world’s knowledge.)

Some suggested readings from:
For grading issues, approach the TA within two weeks; if you don’t receive a satisfactory answer, contact me.

For issues relating to *this class*, email smb+4187@cs. . .

That lets me auto-sort class-related mail and keep better track of things
Programming Assignments

- All programming homework *must* be done in C or C++ unless otherwise instructed. Don’t bother asking for exceptions.
- Turn in a single tar file, including a Makefile.
- If necessary, include test data and a README file with execution instructions.
- All programs *must* compile and run on Linux, on the CLIC machines.
- Zero credit for programs that don’t compile.
- Because most security problems are due to buggy code, there will be copious deductions for bugs or for inadequate documentation.
Co-operation versus Dishonesty

- Discussing homework with others is encouraged.
- All programs and written material must be individual work unless otherwise instructed.
- Please use appropriate file permission mechanisms to protect your homework. (Looking at other people’s work is forbidden.)
- Zero tolerance for cheating.
- See the department’s honesty policy: http://www.cs.columbia.edu/education/honesty

I will assume that you have all read it; you are in any event responsible for its terms and provisions.
Taking a computer security class is *not* an excuse for hacking.

“Hacking” is any form of unauthorized access, including exceeding authorized permissions.

The fact that a file or computer is not properly protected is no excuse for unauthorized access.

*If* the owner of a resource invites you to attack it, such use is authorized.

Absolutely no Trojan horses, back doors, or other malicious code in homework assignments.

No, I’m not joking.
Contacting Me

- Feel free to drop in during office hours.
- I’ll announce changes on my home page.
- I’m amenable to meeting other times, by appointment. You’re welcome to drop in if my office door is open, but I reserve the right to ask you to come back later.
- If you have any questions, please use email rather than telephone; I travel a lot and am not very reachable by phone.
Drop by, just to talk (a good idea if you think you’ll want me to write a recommendation...)  
You don’t need to be in trouble to talk with me...  
If my office door is open, c’mon in  
But — I travel too much
Class Schedule

- The class may occasionally be rescheduled
- All lectures are available via CVN — feel free to watch it that way
- The midterm and final dates will be announced
Elli Androulaki <elli@cs...>

Another TBA?
I prepare slides for each class, and upload them shortly before class time.

Slides (and other information) is uploaded to my web page.

Well, occasionally they’re uploaded shortly after class.

Because the class is being recorded for CVN, you’ll be able to watch any lectures you’ve missed.

General access to the videos starts shortly after the add/drop period ends.
Homeworks

- As noted, approximately five homework assignments
- Homeworks are designed for practice, teaching, and evaluation
- Homeworks must be submitted electronically by the start of class
- Homeworks received later that day lose 5%, the next day 10%, two days late 20%, three days late 30%; after that, zero credit
- Exceptions granted only for unforeseeable events. Workload, day job, etc., are quite foreseeable.
- Problems? See me before the due date
The CLIC Lab

- All programs *must* run on the CLIC machines: http://www1.cs.columbia.edu/CLIC/index.html
- Programs that don’t compile *on those machines* receive zero credit
- You need a CS account to use CLIC; see https://www.cs.columbia.edu/~crf/accounts/
- Some of the CLIC machines are for in-person use; others can only be accessed remotely
Responsibility

- You’re all adults
- You’re all responsible for your own actions
- If there’s something missing, you have to tell me
Practical Focus

- This is not a pure academic-style OS course
- You’ll be experimenting with real security holes
- A lot of (in)security is about doing the unexpected
- The ability to “think sideways” is a big advantage
What is Security?
Security is keeping unauthorized entities from doing things you don’t want them to do.
This definition is too informal...
What is Security?

- Confidentiality
- Integrity
- Availability
Confidentiality

■ “The property that information is not made available or disclosed to unauthorized individuals, entities, or processes [i.e., to any unauthorized system entity].” [definitions from RFC 2828]

■ Not the same as privacy.

■ Privacy: “The right of an entity (normally a person), acting in its own behalf, to determine the degree to which it will interact with its environment, including the degree to which the entity is willing to share information about itself with others.”

■ Privacy is a reason for confidentiality

■ The traditional primary focus of computer security
Integrity

- **data integrity**: “The property that data has not been changed, destroyed, or lost in an unauthorized or accidental manner.”
- **system integrity**: “The quality that a system has when it can perform its intended function in a unimpaired manner, free from deliberate or inadvertent unauthorized manipulation.”
- Often of more commercial interest than confidentiality
“The property of a system or a system resource being accessible and usable upon demand by an authorized system entity, according to performance specifications for the system; i.e., a system is available if it provides services according to the system design whenever users request them.”

- Turning off a computer provides confidentiality and integrity, but hurts availability...
- Denial of service attacks are direct assaults on availability
They Interact

- It’s obvious that violations of integrity can be used to compromise confidentiality.
- In some situations, violations of availability can be used that way as well.
More Definitions

**vulnerability**  An error or weakness in the design, implementation, or operation of a system

**attack**  A means of exploiting some vulnerability in a system

**threat**  An adversary that is motivated and capable of exploiting a vulnerability

(Definitions from *Trust in Cyberspace*)
Vulnerabilities

- The technical failing in a system
- The primary focus of most computer security classes
- If you can close the vulnerabilities, the threats don’t matter
- Or do they?
Threats

- Different enemies have different abilities
- Teenage joy-hackers can’t crack a modern cryptosystem
- Serious enemies can exploit the “three Bs”: burglary, bribery, and blackmail
- You can’t design a security system unless you know who the enemy is
“Humans are incapable of securely storing high-quality cryptographic keys, and they have unacceptable speed and accuracy when performing cryptographic operations. They are also large, expensive to maintain, difficult to manage, and they pollute the environment. It is astonishing that these devices continue to be manufactured and deployed, but they are sufficiently pervasive that we must design our protocols around their limitations.”

*Network Security: Private Communication in a Public World*
Sometimes, requirements are inconsistent and/or incomplete

Conflicts:

- Security versus cost
- Security versus performance
- Security versus acceptability and culture
- Security versus usability
- Security versus security!

We’ll discuss how to detect and analyze such conflicts.
The problem is overconstrained
Among the constraints are cost, human behavior, and ease of operation
In the real world, realistic security is often far more important than theoretical security
What are you trying to protect against whom?
What this Course is About

- Mechanisms
- Threat analysis
- Security architecture
- Assurance
- In short, *engineering* secure systems
